CCH Tagetik

AI interoperability with MCP – co-innovation program with partners

Wolters Kluwer

MCP partner co-innovation kickoff: how it works

You build the agent. We host the MCP Server in your DemoHub.

SIX-MONTH BETA PROGRAM

CCH Tagetik provides

Hosted MCP Server and access to exposed capabilities

Connection credentials and capability documentation

Dedicated support throughout the program

What you contribute

You build your agent, using your preferred AI technology

Reasoning, instructions, orchestration and user experience

A tested use case, validated results and feedback on gaps and controls

No MCP Server development or custom integration for the operations already exposed.

Support: DL-TGK-Aiecosystem@wolterskluwer.com

Available capabilities

Capability area	What your agent can explore
AIH data and foundation	Retrieve data and inspect or configure data structures (read and write)
Data Model and master data	Explore and maintain dimensions, scenarios and hierarchies (read and write)
Financial Reporting	Inspect and maintain selected report configuration (read and write config)
DTP / process configuration	Inspect processes, activities, rules and parameters (read only)
User Provisioning	Search, create, update and delete users (read and write)

222

registered tools

This beta is not production-ready. Expect errors, incomplete coverage and changes.

Discontinuity in the service can be necessary for improvements and updates – we keep you informed!

Planned production scope and beta evolution

Data navigation using AIH and Data Model capabilities is our planned first production use case. Other beta use cases are welcome as roadmap input, but should not be presented to customers as committed scope or delivery dates without CCH Tagetik's confirmation.Beta tools may change before production based on program feedback, and partner agents may require updates.informed by the findings of this program. Partners should therefore anticipate that their agents may require updates before production use.

How your agent discovers capabilities

The full catalog stays behind two tools

DISCOVER

search_tools

Finds operations relevant to the task using semantic search.

EXECUTE

call_tool

Executes the selected operation with its required arguments.

Your agent receives the relevant operation definitions as needed.

Authentication and first connection

DEFAULT PATH

Client credentials

01 CCH Tagetik provides your MCP connection credentials

02 Use them to obtain an access token

03 Connect your agent to the MCP server and use it

Active by default, with credentials provided at program start. No additional onboarding steps.

ON REQUEST

OAuth authorization code

For Copilot Studio or other agentic tools

Requires activation and an exchange of configuration data with CCH Tagetik

Alert us via email if you need to activate it!

Getting your agent connected

DemoHub IdP: what you receive, what you do and what happens next

Step	What to do	What happens
01 Access details	CCH Tagetik activates your client for your DemoHub environment and sends your MCP client ID and secret.	Your client is ready to request access to its permitted environment.
02 Access token	Use the supplied client ID and secret to request an access token, following the connection guide.	The DemoHub IdP checks the credentials and returns an 8hours-valid access token. Request another token once expired.
03 Agent connection	Configure your agent with the MCP address for your environment and the access token.	The MCP Server checks access to that environment and establishes the connection.
04 Database access	Provide your Tagetik API key and database ID to the agent, through configuration or chat.	Each business operation uses that API key. The associated Tagetik user's permissions apply.

NEXT

Run a first read to check that the agent can access the tools and the database.

Your first working test

Before you start

MCP connection

Your agent is authorized to the MCP server through JWT.

Tagetik API key

Available to the agent for its tool calls.

Database ID

Set to the database you want to test.

This test checks access to your selected database.

ASK YOUR AGENT

“Show me existing workspaces in the database.”

What to look for in the agent run

Discover	Read	Return
search_tools	**call_tool**	**Tool result**
Finds the operation workspace_find.	Runs workspace_find with your api_key and db_id.	Workspace data or a valid empty list. isError: false

Confirm the read succeeded

Check the database is correct. When workspaces are returned, compare their IDs with CCH Tagetik.

If something fails: partner actions and support

Identify where it stopped. Keep the request, response and agent trace.

What you see	What you should do	What CCH Tagetik can check
No matching operation	Ask the agent to retry with a more specific request. If still blocked, send us the query and returned results.	Check whether the operation exists and whether discovery or its description needs improvement. No business API call has occurred.
Discovery returns an error	Send the exact search request and error, UTC time, environment and client name/version.	Inspect available MCP/server error logs. The search itself creates no Tagetik business API audit entry.
Tool call fails	Send the selected operation, sanitized inputs and exact error, with the same context and the agent trace.	Check API audit if the call reached Tagetik and audit is configured. Failures before the API may leave no entry.

API audit, when available: time, user, operation, parameters, outcome, error and duration.

SUPPORT

Send a sanitized agent trace with every report. Never include keys, secrets or tokens. **DL-TGK-Aiecosystem@wolterskluwer.com**

Agent example and lessons learned

LIVE DEMONSTRATION

A business request.
The tool journey.
The resulting answer.

The agent we built, the use case we addressed and how we checked the result.

Six months of co-innovation in DemoHub

Today

Shared kickoff
All participating partners

In six weeks

Dedicated follow-up
One-to-one with each partner

Across six months

Experiments and feedback
To follow with customer testers

Your next steps

01 Connect your agent using the credentials we provide.
02 Choose a use case, preferably data navigation.
03 Validate results and report blockers promptly.
04 Capture findings for your individual review.

What we will review together

Implemented use case
Purpose, data/processes accessed and the user journey.

Agent skills and instructions
Prompts, orchestration and workarounds you added.

Results and challenges
Results, gaps, tool descriptions and discovery.

Functional governance
Business boundaries, approvals and audit controls.
