Data Model Update BS GL Account

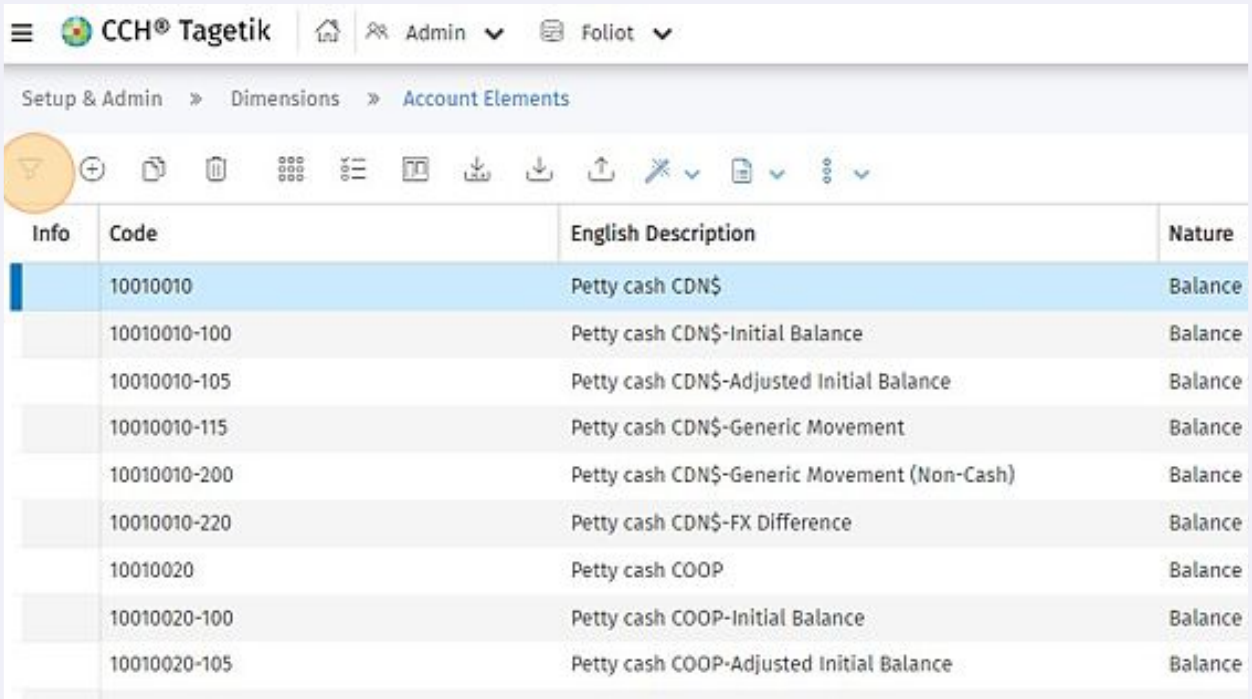

1 Go the Setup & Admin > Dimensions

2 Select Account > List

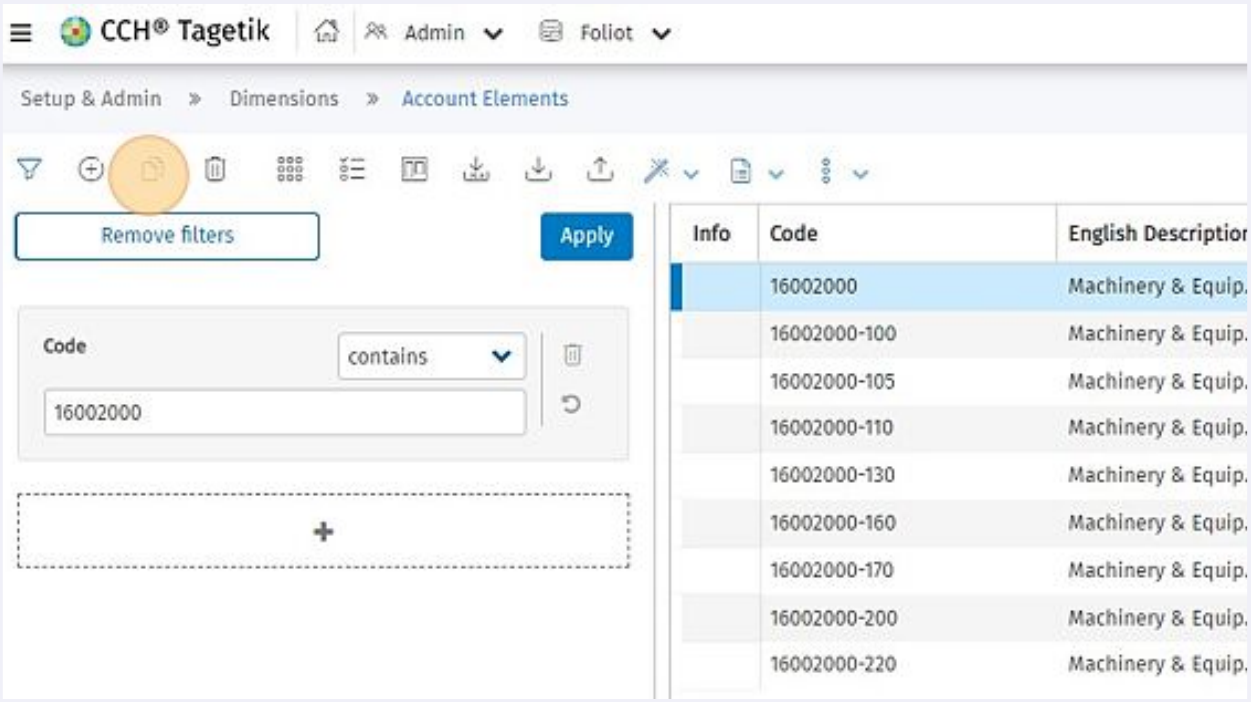

3 Filter on an existing GL Account with similar Attributes & Hierarchy Relationships (1)

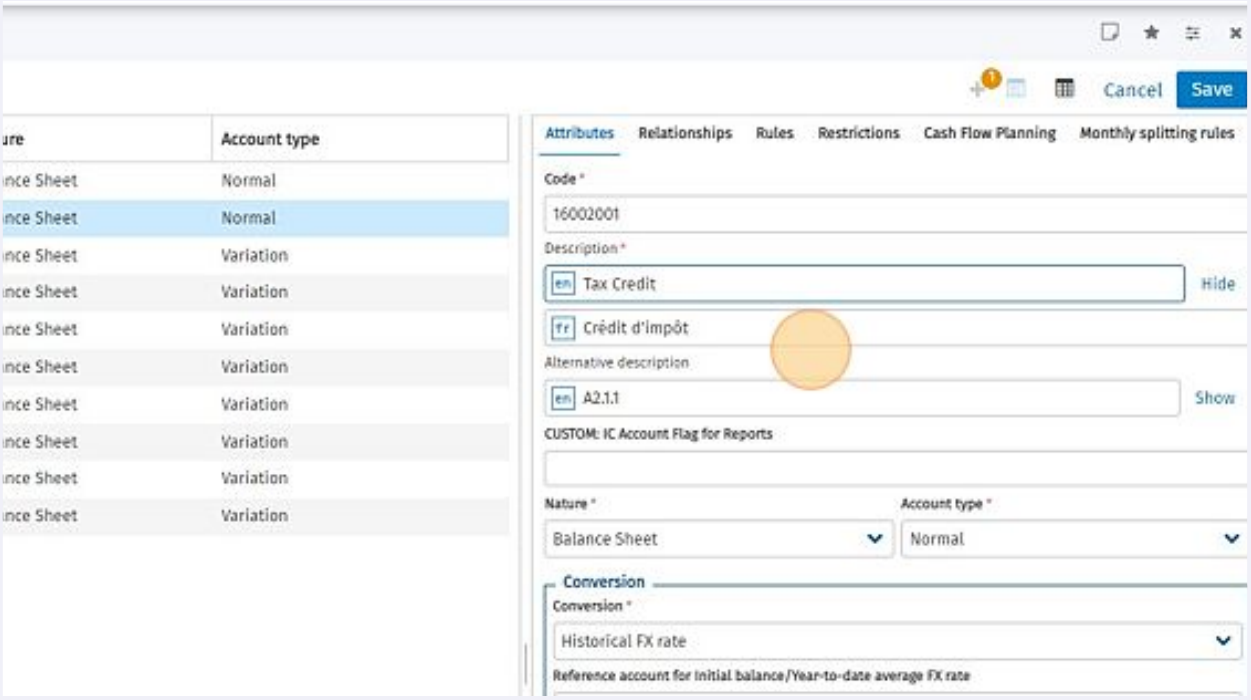

Info	Code	English Description	Nature
	10010010	Petty cash CDN$	Balance
	10010010-100	Petty cash CDN$-Initial Balance	Balance
	10010010-105	Petty cash CDN$-Adjusted Initial Balance	Balance
	10010010-115	Petty cash CDN$-Generic Movement	Balance
	10010010-200	Petty cash CDN$-Generic Movement (Non-Cash)	Balance
	10010010-220	Petty cash CDN$-FX Difference	Balance
	10010020	Petty cash COOP	Balance
	10010020-100	Petty cash COOP-Initial Balance	Balance
	10010020-105	Petty cash COOP-Adjusted Initial Balance	Balance

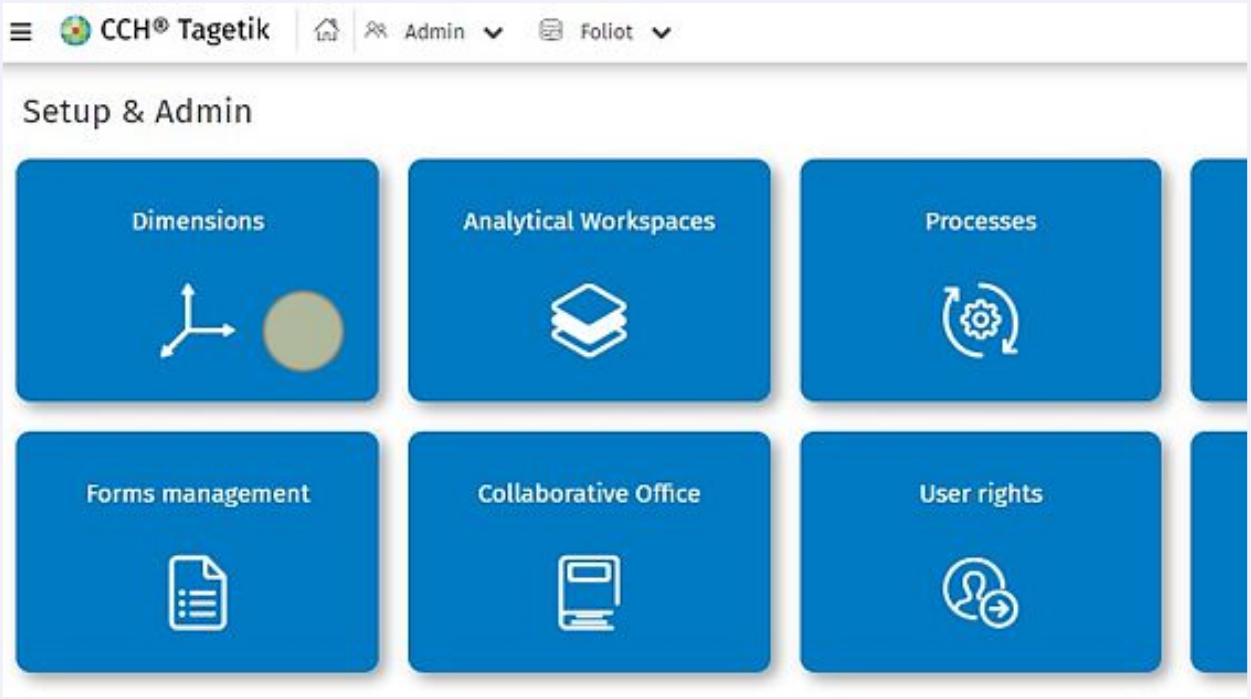

4 Clone the GL account element

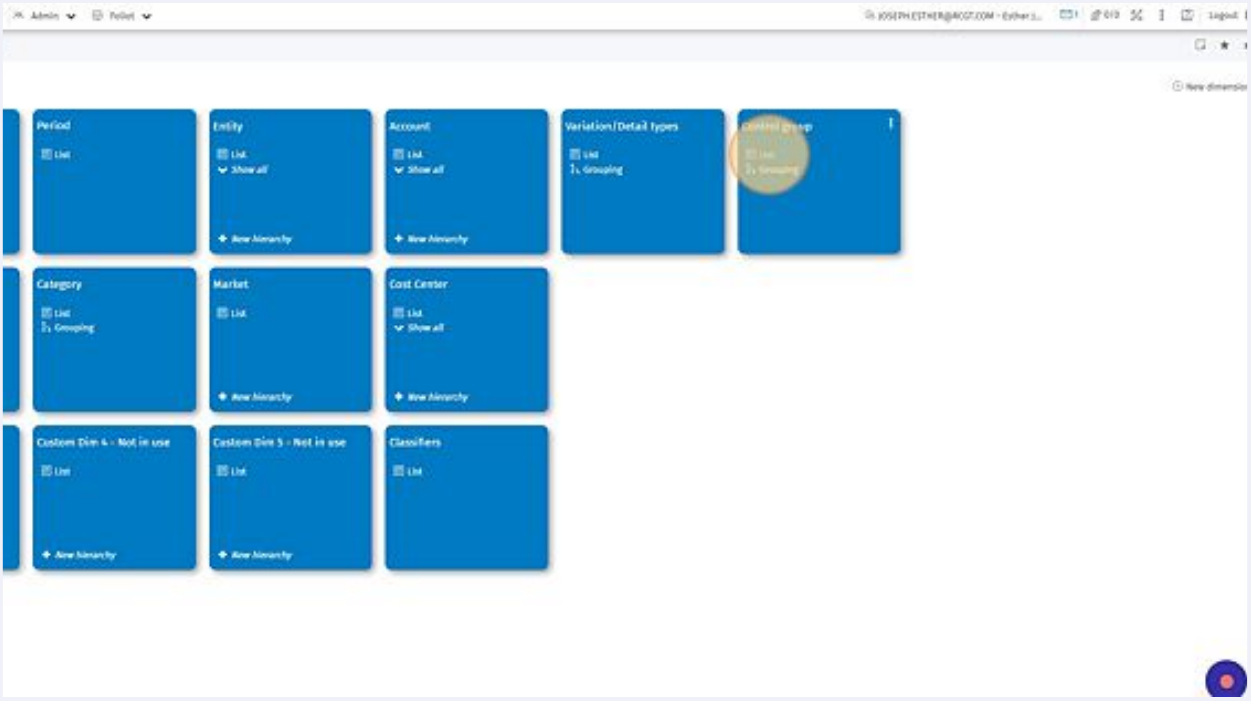

5 Add the new code, descriptions and IC Management if necessary and check that the Hierarchy Relationships are correct. Once this is saved, we would have completed the set up of the normal account and its inclusion in the main hierarchies and FST (the FST are build dynamically).

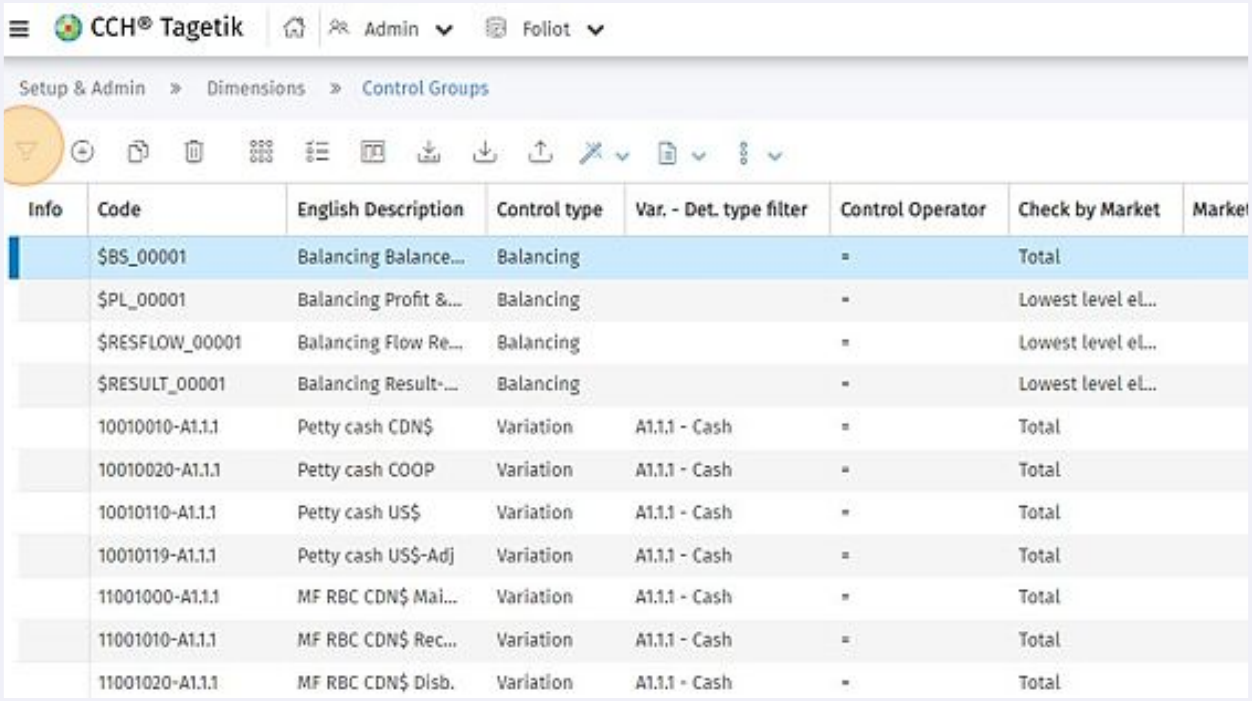

6 The next step is to generate the variation accounts. We need to check how what variation accounts are used for the accounts used as a model. To check this, we need to check the control group. First we need to click on "Dimensions"

7 Next, click on "Control group".

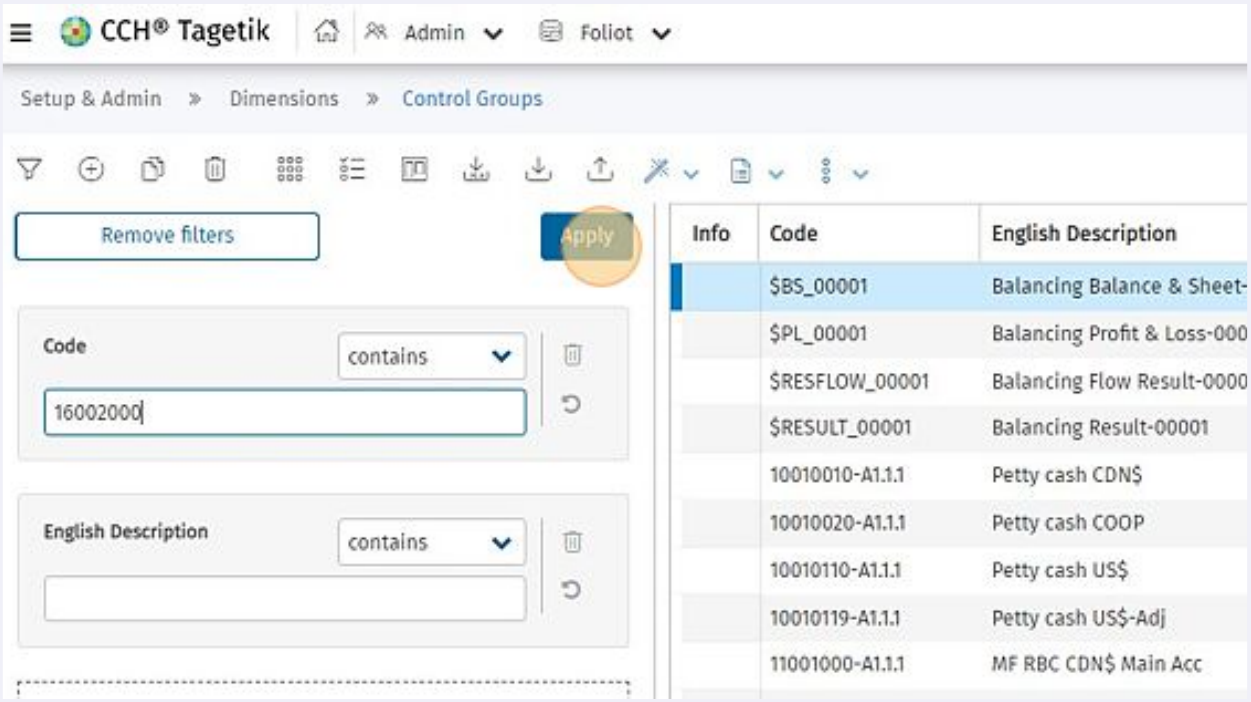

8 Whenever the system generates variation accounts, the system will generate a control group so that the user can check if the sum of the variation accounts is equal to the parent account. The control group highlights the normal/parent account as well as the var. det. type filter used to generate the variation accounts.

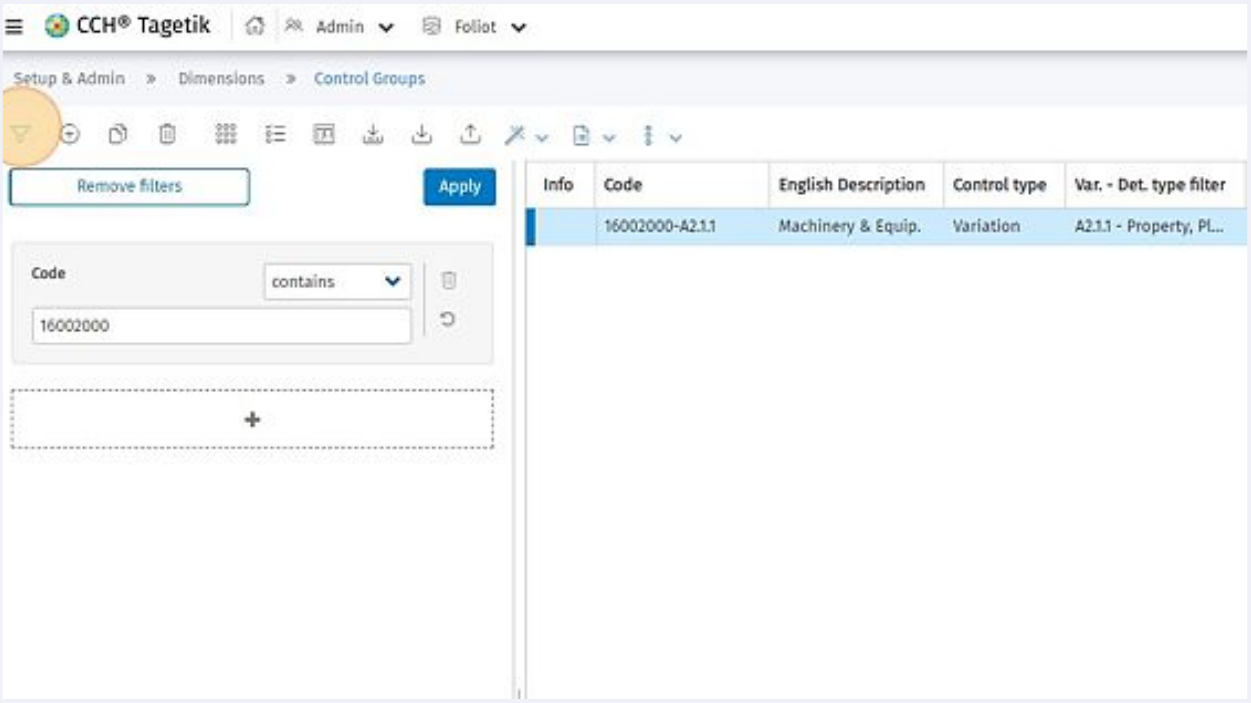

Info	Code	English Description	Control type	Var. - Det. type filter	Control Operator	Check by Market	Market
	$BS_00001	Balancing Balance...	Balancing		=	Total	
	$PL_00001	Balancing Profit &...	Balancing		=	Lowest level el...	
	$RESFLOW_00001	Balancing Flow Re...	Balancing		=	Lowest level el...	
	$RESULT_00001	Balancing Result-...	Balancing		=	Lowest level el...	
	10010010-A1.1.1	Petty cash CDN$	Variation	A1.1.1 - Cash	=	Total	
	10010020-A1.1.1	Petty cash COOP	Variation	A1.1.1 - Cash	=	Total	
	10010110-A1.1.1	Petty cash US$	Variation	A1.1.1 - Cash	=	Total	
	10010119-A1.1.1	Petty cash US$-Adj	Variation	A1.1.1 - Cash	=	Total	
	11001000-A1.1.1	MF RBC CDN$ Mai...	Variation	A1.1.1 - Cash	=	Total	
	11001010-A1.1.1	MF RBC CDN$ Rec...	Variation	A1.1.1 - Cash	=	Total	
	11001020-A1.1.1	MF RBC CDN$ Disb.	Variation	A1.1.1 - Cash	=	Total	

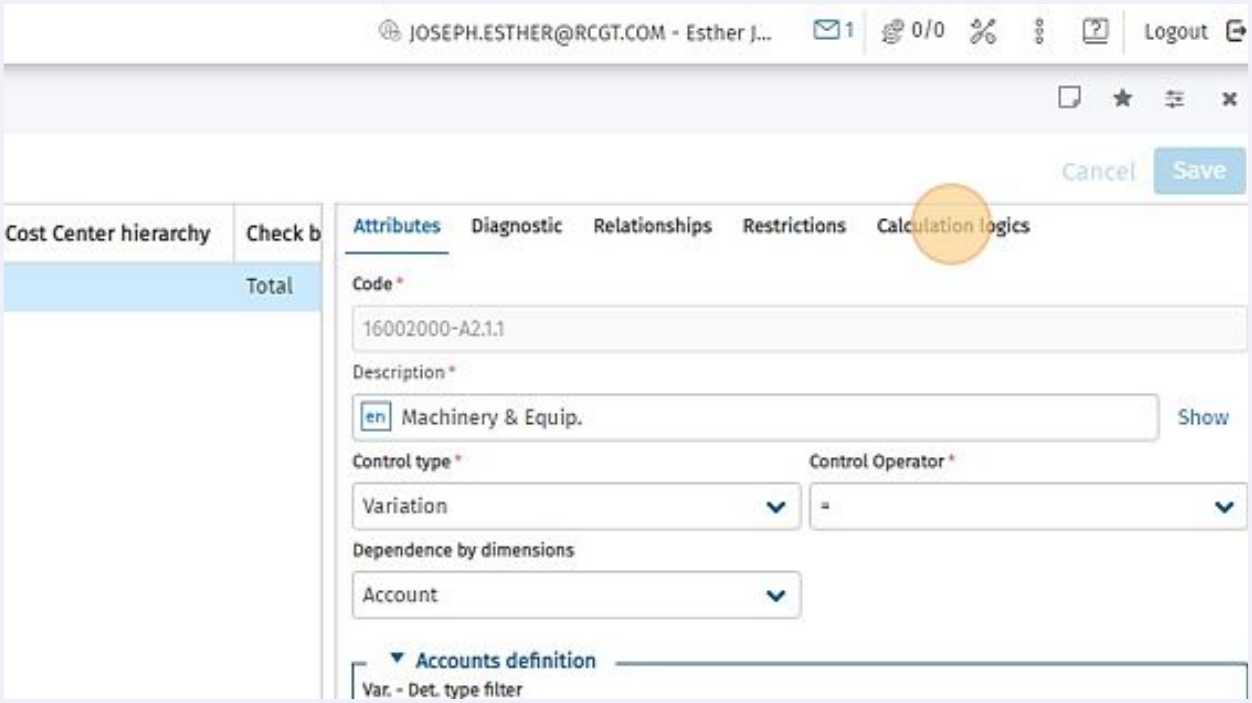

9 We need to check the variation detail type grouping used to generate the variation account of the account we previously cloned for the normal account.

10 We can see that the var. det. type filter is A2.1.1

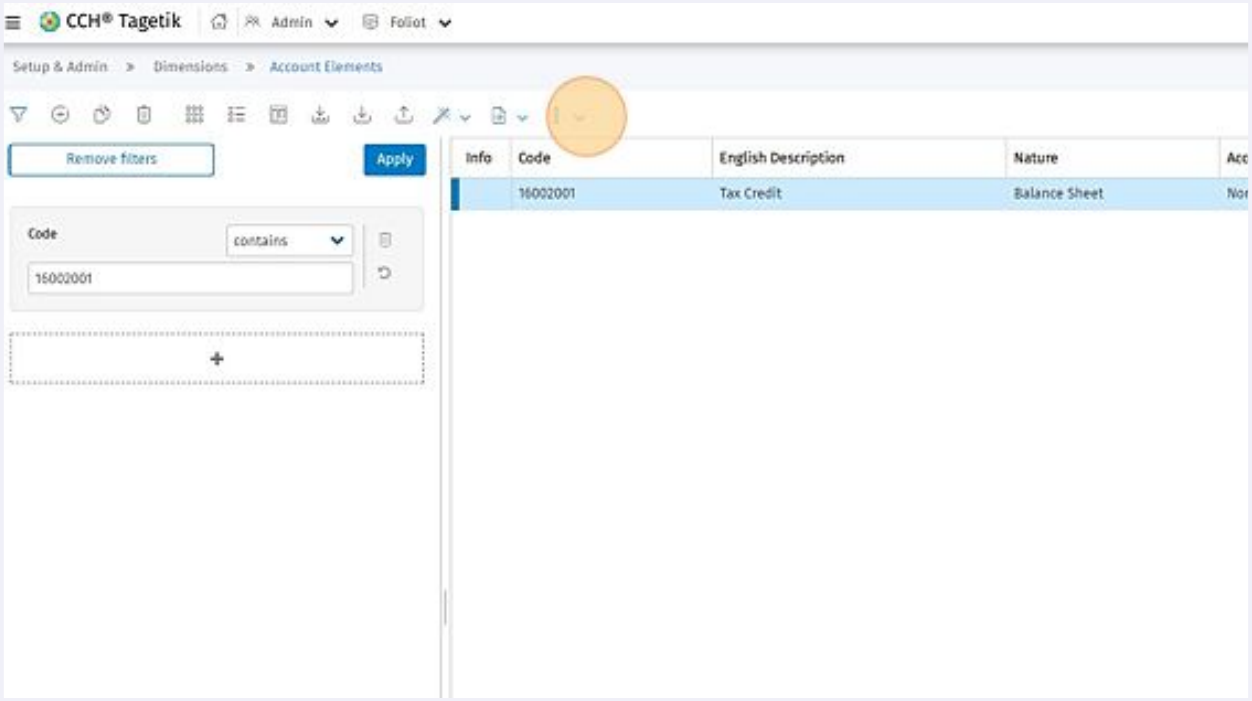

11 The next step is to check the "Calculation logics" on the existing accounts.

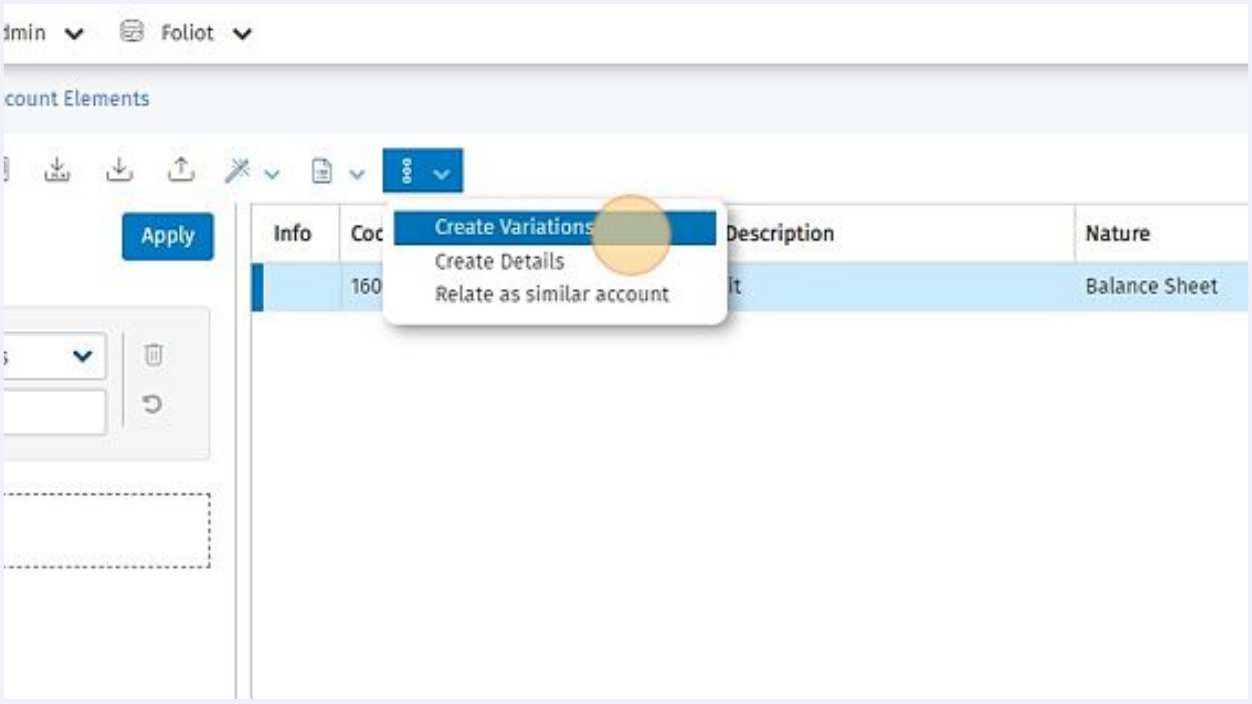

12 For an current assets or current liabilities account, we would have 2 calculation logics: One where variation account is calculated as a difference between the normal/parent account - the initial balances - this is done on the gross amounts. The second calculation is that the normal account is the sum of the variation accounts, this is the case for the journals

13 For the long term assets or long term liabilities, we would have one calculation logic where the normal account is the sum of the variation accounts, this applies only to the journals

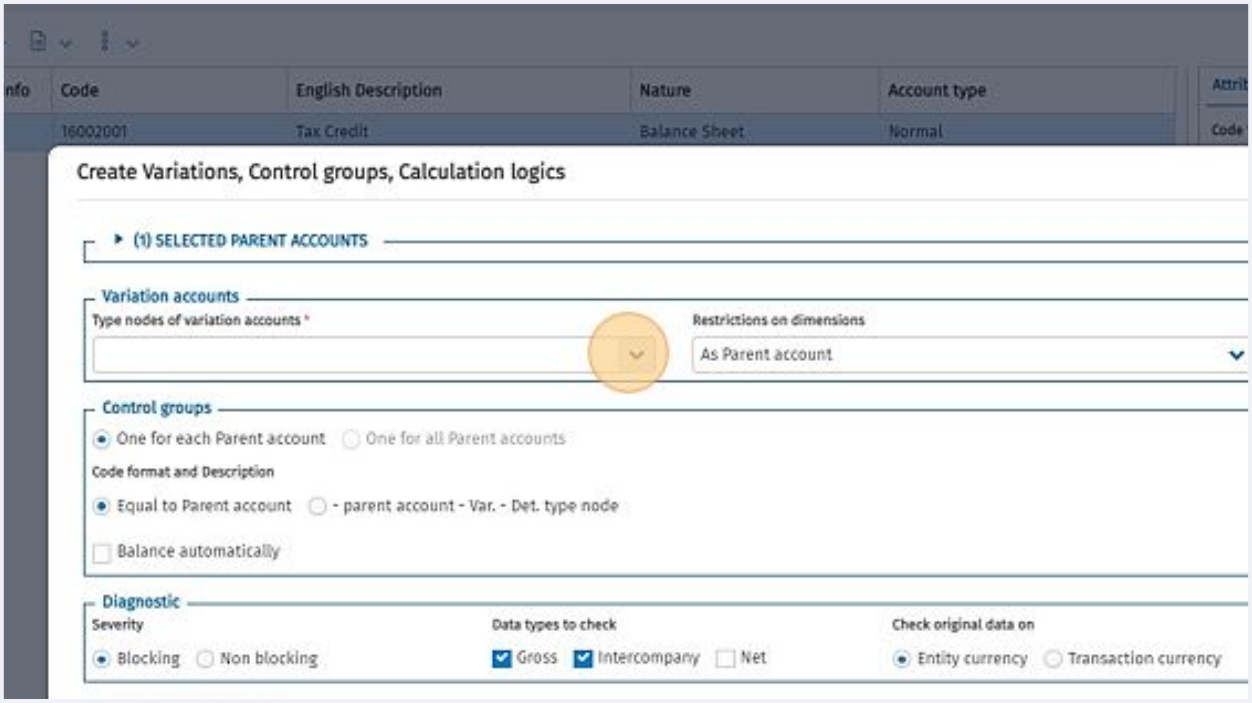

14 Once we have the relevant information, we need to go to the "Account Elements" and type the code of the new normal account created. Then we click on the actions as shown below.

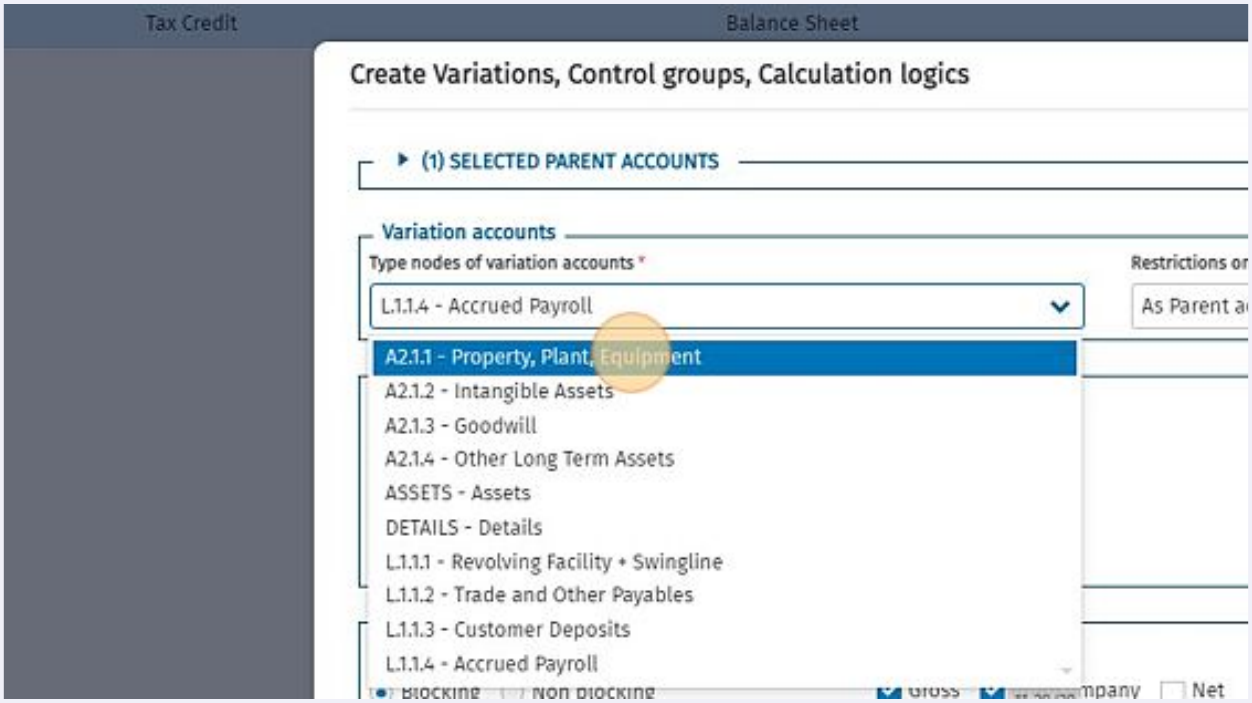

15 Then, click "Create Variations"

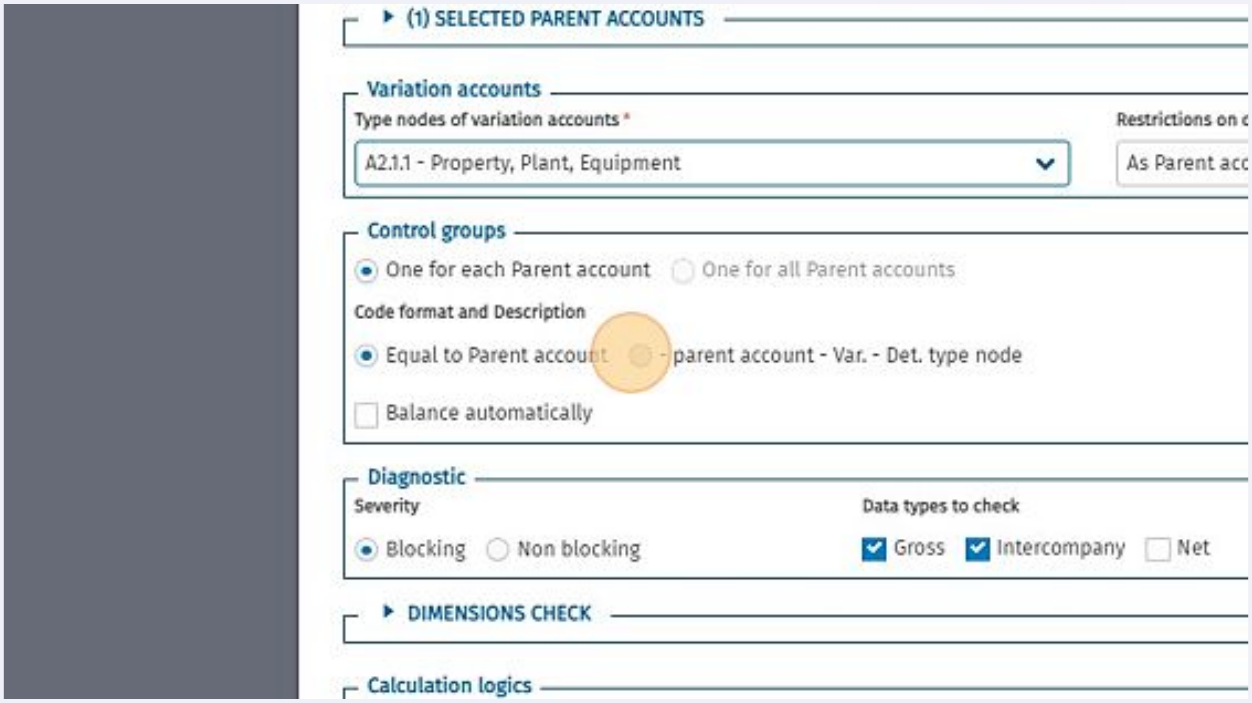

16 This wizard will: 1) Generate the variation accounts, 2) Create a control group, 3) create a calculation logic

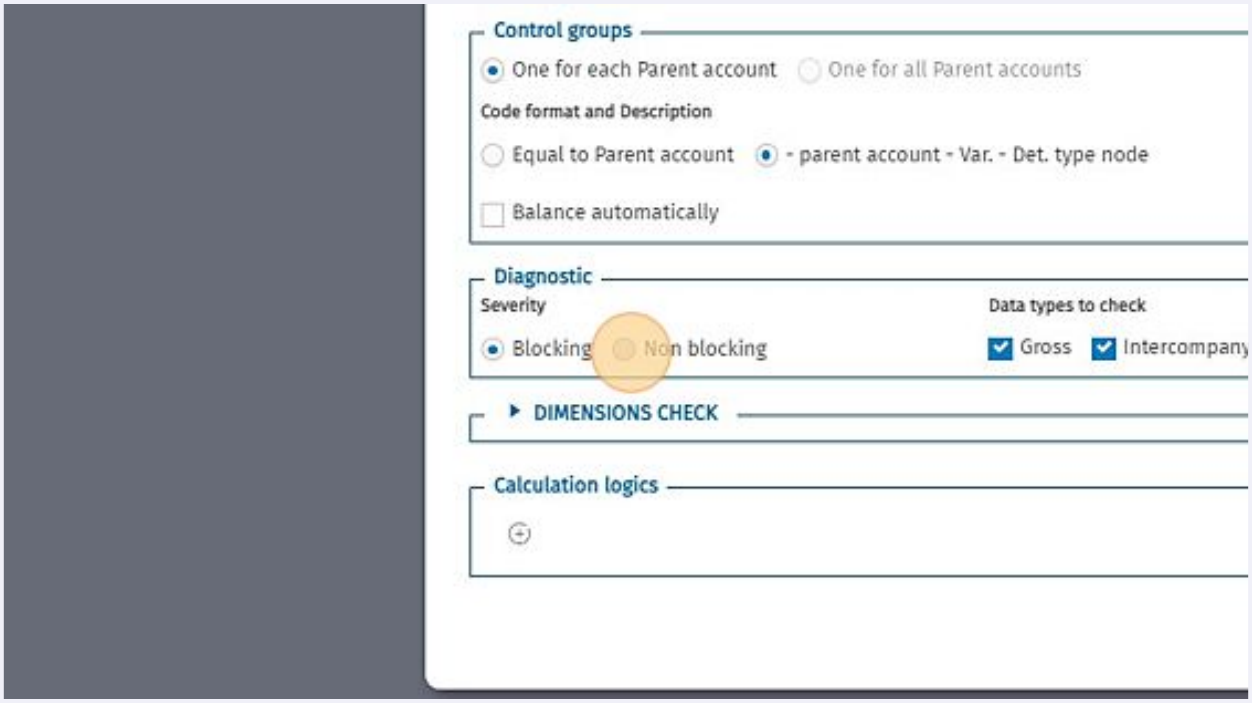

17 Click "A2.1.1 - Property, Plant, Equipment" as the "Type nodes of variation accounts"

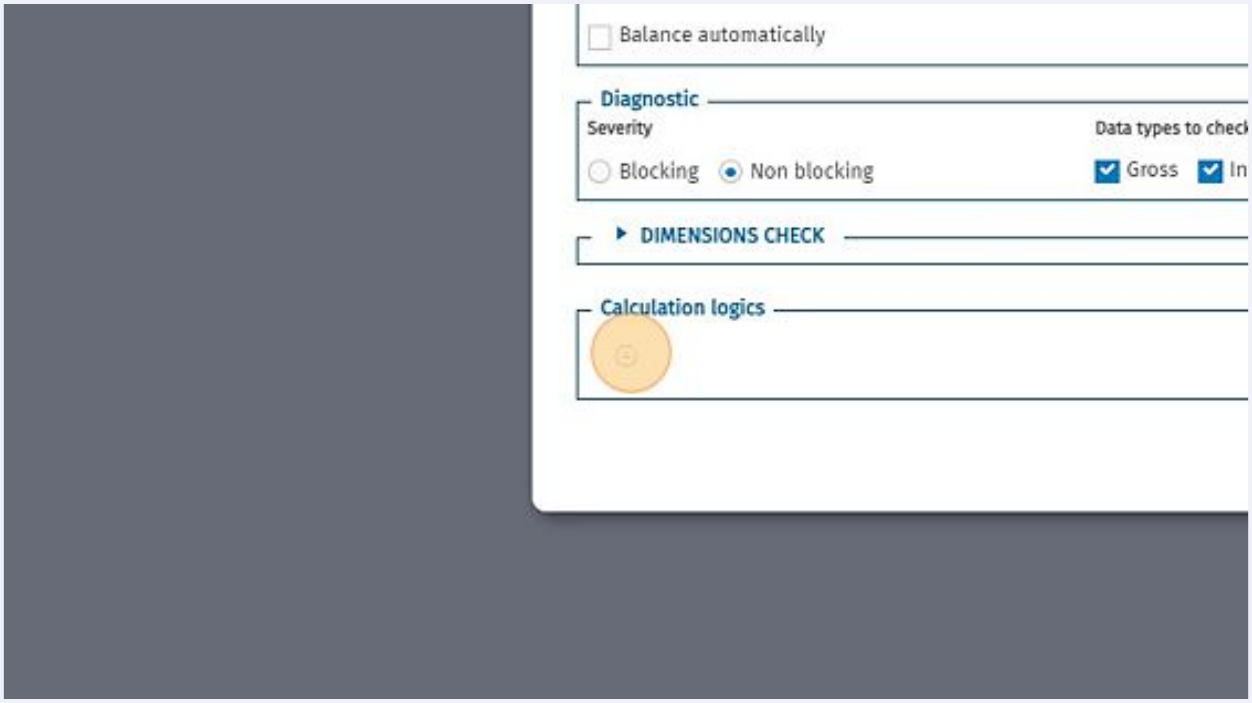

18 Then click "- parent account - Var. - Det. type node" to ensure that the control group codes provides the information about the variations node used.

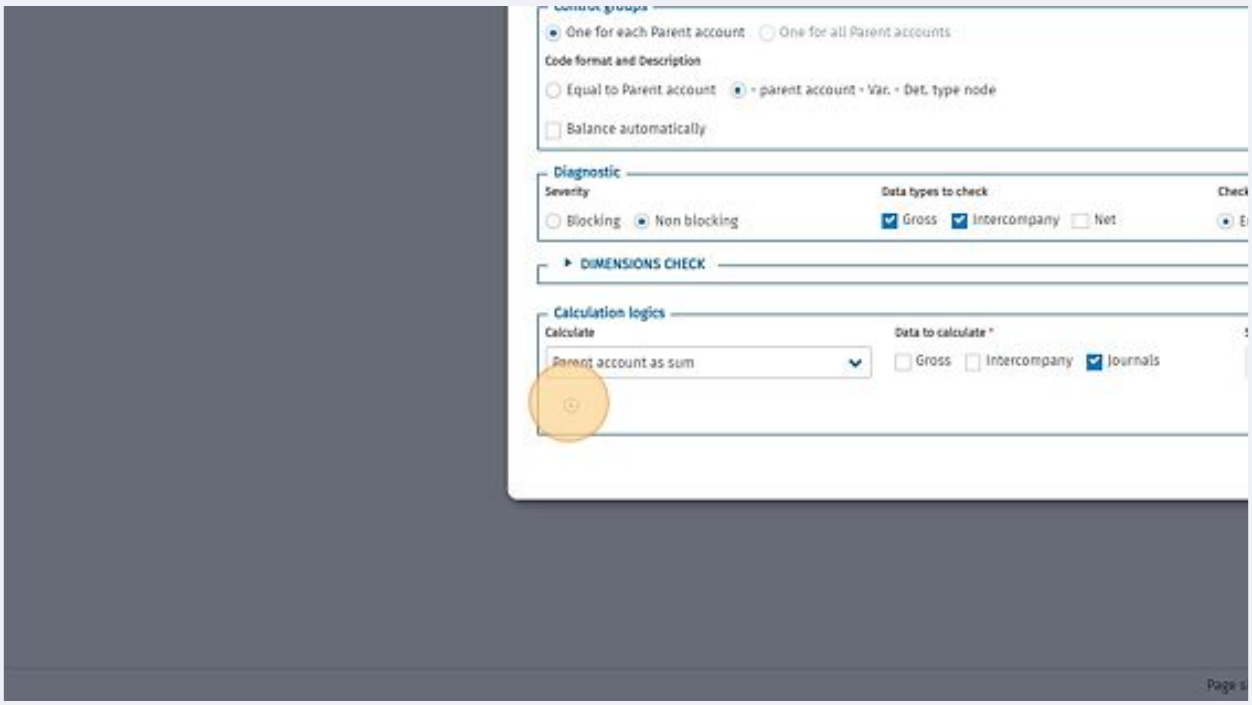

19 Click "Non blocking" for the diagnostic, this can be changed at any time.

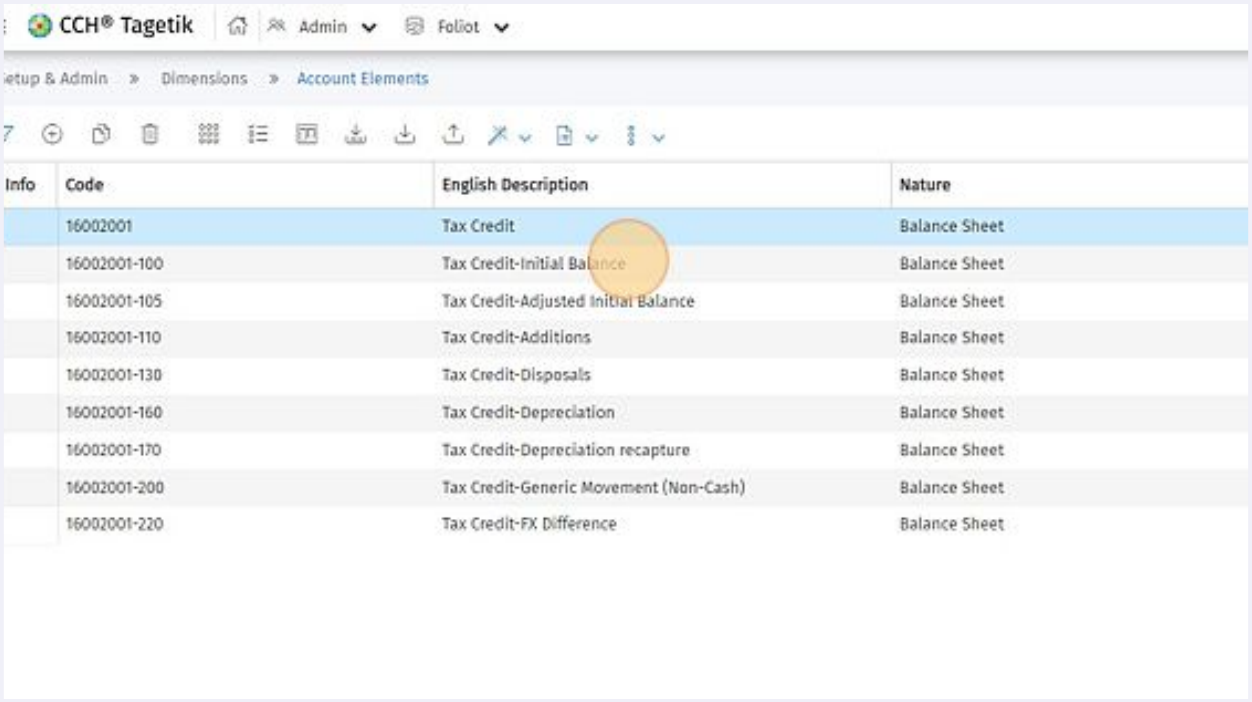

20 Next step is to generate the calculation logics.

21 Set the calculation as "Parent account as sum" for the journals. Then click on "OK"

22 Check that the variation accounts were properly generated.

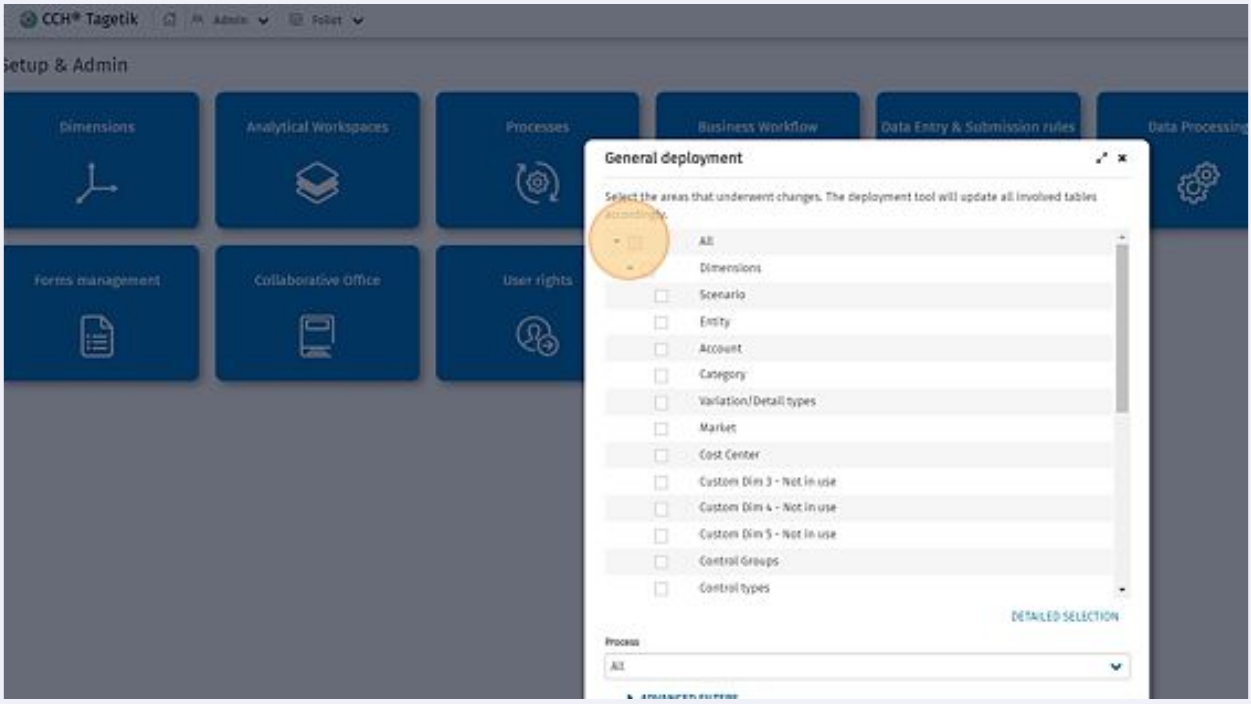

By default, the variation accounts will inherit the attributes of the variations. This is particularly true for the "Conversion Type" and the "IC management".

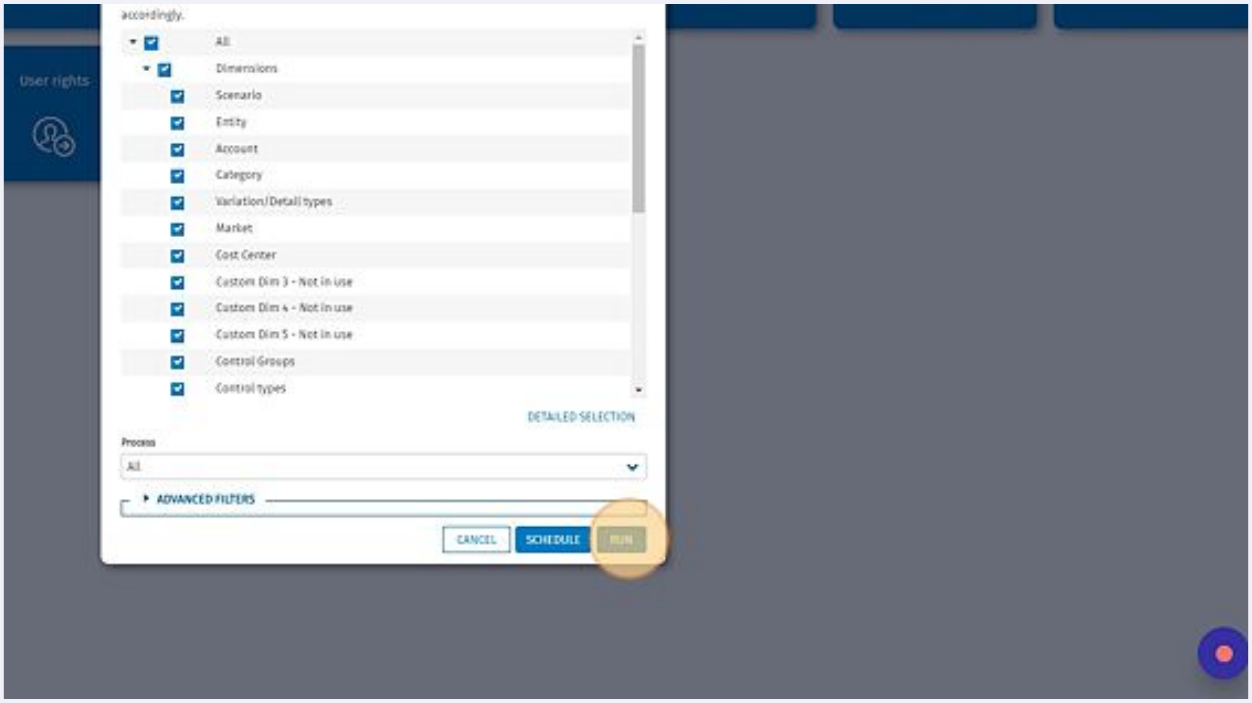

23 Is is important to run a "General deployment" afterwards.

24 Click on "All"

25 And "Run"

To check that everything is ok, it is necessary to check that the new account is added to the "Balance Sheet Movement" data entry form and check that the new control group as well as the new calculation logic is set up.
