What's new in CCH® Tagetik 5.3 Service Pack 34

The AI-powered CCH® Tagetik Intelligent Platform enables finance professionals to democratize access to meaningful financial data, manage and control massive datasets with unprecedented speed and automation, unlock hidden insights, and expedite decision-making. The platform is comprised of 3 components: Intelligent Foundation, Intelligent Solutions, and Intelligent Insights.
CCH Tagetik 5.3 Service Pack 34 introduces a range of new features designed to enhance the platform and its components. These updates offer greater automation, flexibility, and accuracy, simplifying daily tasks, and allowing more time for value-added analysis.

Online User Manual enhancement and redesign

The Online User Manual has been redesigned to make the user experience faster, clearer, and more intuitive.

Why is it useful?

The updated manual is designed to make your reference experience faster, clearer, and more intuitive. With improved navigation and a glossary at your fingertips, you'll spend less time searching content.
Users can now do the following:

- Navigate through a visually engaging landing page, aligned with the CCH Tagetik organization of features.
- Use sub-landing pages to jump directly to relevant topics.
- Access a detailed glossary for quick terminology checks.
- Review all new content in one place with the dedicated "What's New" page.

How to access the updated manual:

No changes on how you access the User Manual, users can continue with their usual access.

New User Interface

Starting from CCH® Tagetik Version 5.3 Service Pack 27, a new UI has been made available for all users. As announced with bulletin n. 75, the CCH® Tagetik Legacy UI has been deprecated in CCH® Tagetik Version 5.3 Service Pack 30 and will be dismissed with CCH® Tagetik Version 5.3 Service Pack 36. Please note that the dismissal has been deferred from Service Pack 34 to Service Pack 36.

Wolters Kluwer

Intelligent Platform

Ask AI for Process Quality – NEW!

Starting with Service Pack 34, Ask AI for Process Quality is now available. This advanced capability acts as an intelligent assistant, helping users execute process-related tasks effortlessly. By interpreting natural language inputs, Ask AI converts them into valid execution conditions and filters, then runs diagnostic checks accurately. With Ask AI, accessing the Diagnostic Hub has never been easier. Maintain process integrity by continuously monitoring data quality through automated diagnostic checks. Quickly surface anomalies, identify issues, and assess potential risks to ensure consistent and reliable operations.
You can find Ask AI for Process Quality on the Cockpit page for Process with dimensions by step.
Note: This feature is available exclusively with the Intelligent Platform Premium license.

Ask AI for Data Transformation – NEW!

Starting from Service Pack 34, Ask AI for Data Transformation is available. It acts as a smart assistant for administrator users, and it is designed to streamline and accelerate the definition and maintenance of DTPs. Specifically, Ask AI supports administrators in two key use cases:

Data Model Information: Ask AI helps identify the objects within the Analytical Workspace that can be manipulated by the DTP, such as dataset fields, parameters, functions, and more. This guidance eliminates the need to navigate the application to collect the needed information and ensures that users can quickly retrieve the objects that are relevant to their transformation logic.

From Text to SQL: Ask AI assists in the creation and maintenance of SQL formulas used in DTP configurations—including filters, execution conditions, matching fields, and other logic rules. By interpreting natural language inputs and converting them into SQL expressions, ASK AI reduces manual effort and minimizes errors in query writing. This feature enhances productivity, reduces technical complexity, and empowers administrators to manage DTPs with greater confidence and efficiency.

The Ask AI for Data Transformation is available on the DTP operations and matching fields pages.

Note: This feature is available exclusively with the Intelligent Platform Premium license.

Process Hub

Process Homepage - Performance Dashboard

The Performance Dashboard has been completely redesigned, featuring a fresh new look and enriched with key insights. The readability of the three main KPIs — Completed on time hierarchy elements, delayed elements, and rejections — has been significantly improved. Users can now compare current process or scenario/period performance with others over time, enabling precise and actionable benchmarking. All details can be exported to Excel for offline analysis and control.

Lock/Unlock Data

In Service Pack 34, we have migrated the Lock Utility in Process Hub, allowing users who have migrated or are looking to migrate to use this functionality. The Lock/Unlock functionality is available for all steps by entity in Process Hub and can be run individually for specific entities/steps or for multiple entities at the same time.

Task Management - Allow Users to define Task Types

In this release we are extending our local close solution with the first release of the Task Management Module with Process Hub. This module allows admin to easily define close tasks within a step of Process Hub, defining deadlines, responsibilities and dependencies for the steps .in a with dedicated interfaces or using bulk load/edit functionality. The tasks defined in interface can then be displayed in a Process Hub allowing users to carry out and declare their tasks as complete in both list or graphical format.

Migrate tool for Process by Entity to New Cockpit - Override blocking errors on Tasks/steps

To allow users to have a smoother migration to the Process Hub in this release we have made some changes to the compatibility checks which are carried out by the copy and migrate tool.
Now if the system finds a step of type contributor/consolidator or tasks which are not yet supported, the system will convert these without blocking the migration process, allowing users to speed up the migration towards Process Hub, leveraging the new functionality and look & feel.

Data Integration

New Connector for Snowflake

Starting from Service Pack 34, a new connector for Snowflake has been introduced to enable a seamless integration between CCH Tagetik and Snowflake. This enhancement enables users to connect directly to a Snowflake platform to ingest data into CCH Tagetik. This integration simplifies the integration with Snowflake and streamlines operations for users already working in Snowflake. "Key Pair" authentication and "OAuth2.0" authentication will be supported by the connector.

New Connector for Google BigQuery

A new native connector for Google BigQuery is now available with Service Pack 34, to enable a seamless integration between CCH Tagetik and the Google Cloud Platform. This enhancement enables users to directly connect to BigQuery to ingest datasets into CCH Tagetik, supporting both scheduled and on-demand data flows. The connector is optimized for enterprise-scale data volumes and is designed to streamline operations for users already leveraging BigQuery as their data warehouse. The "ADC JSON Key" authentication is supported, while the "Google Cloud Environment Credentials" authentication is supported when the beta feature flag is enabled.

Configuration Deployment Tool

The following AIH resources are now supported in the tool:

- Dataset - Data Target Mapping: File
- Dataset - Data Target Mapping :Update Data Model
- Dataset - Data target mapping: XBRL
- Dataset - Data target mapping: Update rules
- Dataset – Data Target Mapping: XML

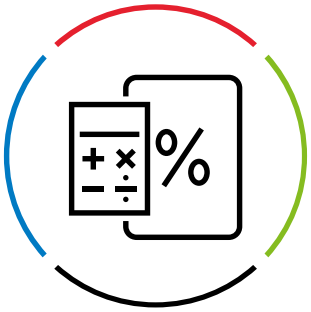

Rollback Functionality

This functionality is essential for ensuring greater control and superior flexibility in configuration deployment processes, allowing for the quick reversal of any errors or unwanted modifications.

What can users do now? Users can now perform rollbacks of unwanted changes or errors during the transfers, thus improving the management and control over their target environments.

How does this feature work? Each transfer is meticulously logged, making it easy to perform a rollback of the most recent data processing. This means that if an error or an unwanted change is detected, the user can quickly revert to the previous state. The rollback functionality is available exclusively for transfers where the deletion policy is set to "None". To access this feature, ensure that the deletion policy is correctly configured before executing the transfer.

How to access the feature: This is accessible directly from Configuration Deployment Tool Interface.

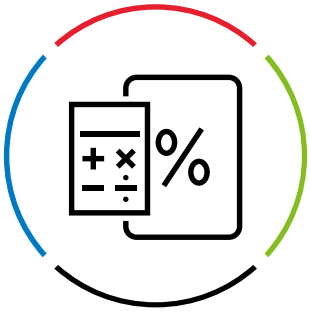

Intelligent Solutions

CCH Tagetik Financial Close & Consolidation

Consolidation of Investment (CoI) Report

The consolidation of financial investments and net equity accounts is one of the most critical and complex steps in any statutory consolidation cycle. Service Pack 34 introduces a new report that enables consolidators, sub-consolidators, and auditors to track and monitor all information related to the Consolidation of Investment — from input data to elimination journals. The report is accessible from the Process Hub Cockpit via the “Reports” button and includes the following key information:

- Financial investment elimination journal;
- Ownership Structure Register (including event details, financial investment, and net equity accounts);
- Contribution of the owner entity to financial investment accounts;
- Contribution of the owned entity to net equity accounts; and
- Consolidation method and percentages.

Rules Engine Designer (RED) - Periodic Data Processing on Consolidation Scenario

The use of Periodic Consolidation is increasingly spreading across the financial ecosystem, as it provides a more accurate reflection of fiscal year events in relation to the historical evolution of the group structure. The periodic RED offers greater flexibility by enabling users to independently manage rules to meet specific business requirements. It can be applied both in Periodic Consolidation processes and in Year-to-Date Consolidation processes. Typically, the periodic option is used in combination with the Dynamic Markup feature. Users can define, for each rule executed within a consolidation scenario, whether to apply the periodic or year-to-date calculation approach.
Periodic calculation allows for more accurate amounts when the dynamic markup is present. Additionally, it enables the generation of variation flows due to changes in rule application compared to the previous period. The available options are:

- Progressive: it calculates the year-to-date amount for the processing period, applying the dynamic markup defined for that period. This is the default option and the option for existing rules;
- Periodic – Start of Period: it calculates the periodic amount on which to apply the dynamic markup. Changes in dynamic markup or rule application compared to the previous period are considered to have occurred at the beginning of the period;
- Periodic – End of Period: it calculates the periodic amount on which to apply the dynamic markup. Changes in dynamic markup or rule application compared to the previous period are considered to have occurred at the end of the period.

The following rows are generated during periodic calculation:

Period Quota: the difference between the amount of the current processing period and the previous period. (This calculation is performed even if data for the current period is missing.) The dynamic markup is applied as follows:
- Start of Period: Dynamic markup of the current processing period.
- End of Period: Dynamic markup of the previous period.

Copy from Previous Period: starting from the second period of the scenario, the rows generated in the previous period are copied.

Dynamic Markup – Variation from Previous Period (only if configured):
- Start of Period: Parent account amount from the previous period × delta markup.
- End of Period: Parent account amount from the current processing period × delta markup.

Rows generated by periodic calculation can be identified by the content of the “Notes field”, which includes the label “[Periodic]”.

CCH Tagetik Intelligent Disclosure

Workflow on Document Part for Approval

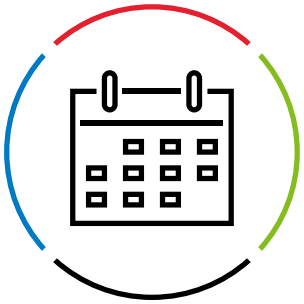

Users can now set up multi-level approval workflows (up to five levels) for Intelligent Disclosure documents. Approvers and user groups can be assigned at each level, ensuring clear accountability and smoother collaboration in the document review process.

Why is it useful? This feature replaces manual approval tracking with a built-in, transparent workflow—improving control, auditability, and teamwork.

What can users do now?

- Define up to five approval levels per document part
- Assign approvers as users or groups
- View approval status and next approver in the Word Add-In
- See who submitted the document and when

How does this feature work? When configured, the Word Add-In displays each approval step and routes submissions automatically to the next approver. Approvers review, approve, or reject documents directly in Word, with status updates visible to all participants.

CCH Tagetik Extended Planning

New Version of Supply Chain Planning Record View

The new version of the record view for the Supply Chain Planning process will enhance the user experience by enabling navigation within a newly dedicated User Interface that simplifies and streamlines data visualization. The goal is to improve and standardize the User Experience across the Tagetik platform.

Why is it useful? This feature allows users to view Supply Chain Planning record view data in a way that is fully integrated with the Tagetik User Experience, simplifying user tasks. Additionally, users will be able to customize the record view by adjusting the size of its components, such as tables and charts.

What can users do now? The previous version of the record view was available within the workflow but displayed the legacy version of Supply Chain Planning. It was also not possible to customize the sections that make up the record view.

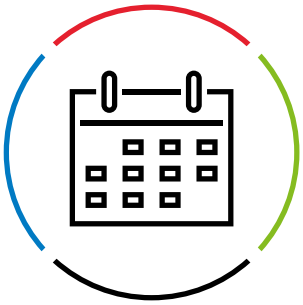

How to access the feature: The feature is accessible via the beta feature toggle. Once inside the record view through the workflow, a dedicated button allows users to switch to the new version.

Supply Chain Planning

Export Safety Stock

Projected Safety Stock is now available as a virtual dataset for core export and reporting.

Why is it useful? Safety stock is often used by other business planning systems. If CCH Tagetik represents the plan of record or best available

source for safety stock projections, this feature can be used to supply or updates those business systems or management reporting which require updates to projected safety stock

What can users do now? Export projected safety stock values to either reporting or other business systems with the click of a button.

ESG & Sustainability Performance Management

IFRS Japanese localization

Our ESG Metrics & KPIs module now supports Japan's jurisdiction-specific adoption of ISSB standards for sustainability disclosure.

Why is it useful? Entities may voluntarily apply the standards for annual reporting periods ending on or after March 2025. The Japanese Financial Services Agency plans to gradually introduce mandatory disclosure starting from the fiscal year ending March 2027 for large companies, with phased expansion to other companies in subsequent years.

What can users do now? Users can streamline sustainability reporting and ensure third-party audit readiness by leveraging a pre-built KPI library and calculation logic aligned with regulatory requirements.
This module provides the ability to:

- Accurately calculate and report relevant KPIs
- Ensure robust audit trail for third-party audit-readiness
- Streamline sustainability report narrative crafting with AI-powered intelligent disclosure.

How does this feature work: The content can be accessed in the same way and with the same functionalities of existing frameworks.
How to access the feature: ESG Metrics & KPIs module.

EU Taxonomy Solution Regulation Review

Why is it useful? The latest version of the EU Taxonomy Solution introduces new regulatory updates based on Commission Delegated Regulation of July 4th, 2025 (Omnibus Regulation). These updates permit to disclose the new EU Taxonomy Templates just on data of December 2025.
What can users do now? Users can submit and disclose the new Templates based on the newly released European Commission Delegated Regulation starting from data of December 2025. They can benefit from the updated default configurations: Reporting, Calculation logics, workflow, use of Materiality Threshold, calculations and elaborations to disclose the latest structure of the final Templates.

Carbon Emission: Cross-Scenario Replication and Restatement

Why is it useful? Loading data from any Scenario–Period enables fast and efficient GHG emissions restatement without the need to re-

import data or reapply emission factors. This significantly reduces manual effort and simplifies recalculations or restatements of historical data but also the performance of what if analysis on past and current Scenarios.

What can users do now that they could not do before? Users can now reuse input data from any previously created Scenario and load it into a target in-work Scenario. For example:

- Load input data from one Scenario and apply emission factor mappings from another.
- Restate emissions from past Scenarios.
- Perform "what-if" analyses by testing different factor mappings or assumptions on existing datasets.

How does this feature work? For any Dataset within the module, users can now copy data into the in-work Scenario–Period from any other Scenario–Period, whether active or inactive. This provides full cross-Scenario flexibility, as source Datasets do not need to belong to the same Scenario–Period as the target. Users can directly select the source Dataset partitions, Scenario, and Period, and the system will automatically load the corresponding data into the target Datasets.

How to access the feature: The functionality is available in the Carbon emissions Module.

Carbon Emission: Integration with CSRD Energy Disclosure KPIs

The tighter integration between the Carbon Emissions and CSRD module significantly reduces manual data entry efforts. The more data collected in the Carbon Emissions module, the less users need to manually input in the CSRD module. Importantly, this update ensures that users retain the full granularity of their Carbon data, even when the Entity perimeter structures differ between modules. This means no loss of valuable detail in the data flow across modules.

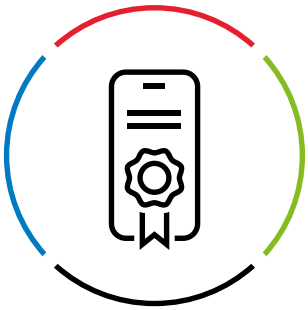

What can users do now? Previously, only GHG emissions data could automatically feed into the CSRD module, leaving energy consumption data without a direct use case. Now, users can:

- Automatically transfer energy consumption data (Scope 1 and 2) from the Carbon Emissions module into the CSRD module.
- Leverage granular energy data for both reporting and performance tracking.
- Reduce redundancy, as there is no longer a need to re-enter energy-related data manually.

How does this feature work? The Carbon Emissions module's Scope 1 and Scope 2 energy consumption inputs can now feed into a dedicated Dataset, which:

- Can serve as an output form to structure and analyze the company's energy mix
- Automatically populates quantitative KPIs under the CSRD E1-5 Disclosure
- Allows users to map custom KPIs featuring energy measures

How to access the feature: The functionality is available in the Carbon Emissions module.

Regulatory Solutions

CCH Tagetik Solvency II – EIOPA Solution

Why is it useful? it keeps reporting compliant with the latest regulatory updates required by the European Insurance and Occupational Pensions Authority (EIOPA). These updates are based on the newly released EIOPA Data Point Models and XBRL Taxonomies version 2.8.2 Nace 2.1 Optional, published on June 30, 2025. They will be applicable starting from Q4 2025 and for the annual 2025 reference periods, until a new release is announced.

What can users do now?

- Users can now submit Q4 2025 and 2025 annual closing using pre-configured content aligned to EIOPA 2.8.2 NACE 2.1 Optional.
- Users can now leverage default accounts, custom dimensions, standard ETLs, calculation logics, disclosure reports, and XBRL mappings to complete end-to-end Solvency II reporting with fewer manual steps.

CCH Tagetik Solvency II – Bank of England (BoE) – Prudential Regulatory Authority (PRA)

Why is it useful? it ensures Solvency UK submissions align with Bank of England Prudential Regulatory Authority (BoE - PRA). These updates are based on the newly released BoE Data Point Models and XBRL Taxonomies version 2.0.2 (published October 2nd, 2025), effective Jan 1, 2026 for reports with a reference date on or after Dec 31, 2025.

What can users do now?

- Users can now submit closing submissions for Q4 2025 and forward-looking periods using the pre-configured Solvency II solution.
- Users can now use default accounts, custom dimensions, standard ETLs, calculation logics, disclosure reports, and XBRL mappings for an end-to-end Solvency UK process.

Corporate Tax

CCH Tagetik Operational Transfer Pricing - NEW

Why is it useful? The Operational Transfer Pricing (OTP) solution streamlines and automates the entire transfer pricing lifecycle—from data ingestion to margin monitoring and adjustments, supporting compliance, transparency, and efficiency in managing complex intercompany transactions. It enables finance and tax teams to proactively manage transfer pricing risks and avoid year-end bottlenecks.

What can users do now? Main features that users can exploit are:

- Data integration & segmentation: easily ingest and segment data using pre-configured Excel loaders and rule-based engines;
- Year-end data projection: project future data for forecasting and simulate year-end outlooks;

- TP methods & benchmarks: define and apply TP methods and benchmarks at granular levels (segment and SKU);
- TP monitoring: perform automated TP calculations and monitoring margins against benchmarks in real-time;
- Adjustments: manage adjustments, including intra-year and period-end adjustments. For example, having as an outcome the proposed adjusted price lists for proactive TP management;
- Reporting dashboarding: visualize intercompany flows through the Transaction Matrix and interactive dashboards.

How does this feature work?

- Data integration: Users upload actuals, forecasts, and metadata via Excel-based routines.
- Segmentation & mapping: Transactions are segmented by entity, trading partner, and TP function using configurable rules.
- TP method application: The engine applies methods like Cost+ and TNMM at segment and SKU level.
- Adjustments: Users can define intra-year and period-end adjustments based on deviation to range or target, or manually.
- Reporting & monitoring: Dashboards and reports provide insights into margins, compliance status, and transaction flows.
- Price setting: Adjusted price lists are generated based on forecast quantities and applied adjustments.

How to access the feature: All features are accessible directly within Release 1 of OTP module of CCH Tagetik.

Global Minimum Tax for Pillar 2

Enhanced GIR Reporting & XML Tool for Seamless OECD Compliance

Why is it useful? Improves the user experience by reducing manual effort and increasing efficiency.

The GIR has been enhanced primarily through new automation features that simplify the retrieval of information. As for the XML, it has been updated with improvements in configuration and the availability of pre-set settings.

What can users do now? Users can now rely on a more complete and standardized XML structure and GIR reporting that automates tasks previously handled manually. This allows for smoother integration, better compliance with OECD standards, and a more streamlined workflow in managing tax-related data.

How does this feature work? Regarding the GIR, the user workflow has remained largely unchanged. It still involves an initial mapping phase between the GIR data points and those of the solution, followed by a data collection phase for information that cannot be retrieved automatically. Finally, through specific processing steps, users can access the GIR for CE filing purposes. On the other hand, the XML flow has undergone significant improvements, particularly in the configuration phase. This phase has been enhanced and enriched in several aspects, leading to a completer and more customizable setup and ultimately generating a downloadable output.

How to access the feature: The GIR feature, in terms of collection of data and reporting output, is accessible from the Reporting phase; The XML configuration, instead, is available in the Filing phase.

Allocation Support: Automating Flow-through Entity Investments

Why is it useful? it enables automatic allocation between entities in scenarios involving Investment Flow-Through Entities.
What can users do now? Previously, scenarios involving Investment Flow-Through Entities were excluded from the automatic allocation calculation tool. With this release, users can now automatically manage allocations for these entities, identify relevant tax settings (e.g., Tax Transparent or Reverse Hybrid), and incorporate them into GMT and QDMTT calculations—streamlining the process and reducing manual intervention.
How does this feature work? It is now possible to identify investment entities using the "Business Activity" field and to label them through the dedicated "FTE" field in the Entity Configuration. The path discovery functionality will then be able to detect, by analyzing the group structure and the right to profit percentage, the reference entity or entities that must determine whether the investment entity is considered a Tax Transparent or a Reverse Hybrid. At this point, it will be possible to identify the relevant settings for automatic allocations, both for GMT and QDMTT calculations. Through the Allocation Definition report, it will be possible to define any third-party eliminations or allocations criteria to be carried forward as part of the TSH and full calculation. The dedicated calculation tool will then allow users to review the data rectified by the allocation and, if necessary, make further manual adjustments before proceeding with the rule calculation.
How to access the feature: The feature can be configured during the Initialization and Localization steps for both GMT and QDMTT purposes. At the group level, within the Transitional Safe Harbors and Data Collection steps, users can run the calculation data processing. Additionally, dedicated Allocation Data Check and Adjustment forms are available to review and, if needed, refine the calculation results before proceeding with the QDMTT and GMT calculation.

Streamlined UX for Effortless Deferred Tax Management

Why is it useful? The user can benefit from a new approach to managing deferred taxes, aimed at improving the overall user experience.
What can users do now? It is now possible to upload Deferred Tax Accounts using three distinct methods that can be chosen at entity level. Moreover, regarding the recapture feature, it is now possible to bulk upload the DTLs to be tracked using a standard template. Additionally, a new monitoring method labeled 'Item by Item' has been introduced.
How does this feature work? Each entity can select the most suitable loading method based on its data availability in the Entity Configuration form: 01 – Through Data Catalog (Simplified), 02 – Through the Deferred Tax Form, 03 – Through Data Catalog (Simplified) + Recasting

and Unrecognized DT via Standard Template. Moreover, to support the user, the Deferred Tax Form is now divided into two sections: one dedicated to data and information collection and the other to result validation. Also, the Item-by-Item methodology can be selected as monitoring logic and a dedicated section is now available in the Recapture Form.

How to access the feature: The Deferred Tax Accounts loading policy can be set in the Entity Configuration form, in the Initialization step. The loading of data and information is accessible from the Data Collection step, in terms of standard excel template and the Deferred Tax data entry Form; the same applies to monitoring feature. The result validation can be checked in the Qualified Domestic Taxes and Globe Full phases.

CCH Tagetik Tax Provision & Reporting

Deep-dive Tax Proof

Why is it useful? A new experience to simplify tax analysis and strengthen monitoring and audit readiness. This new version empowers finance teams with faster insights and greater transparency.

What can users do now? Previously, users had to analyze data line by line using drill-through capabilities. Now, they can access a fully deployed version.

How does this feature work? A new, ready-to-use template is available as part of the workflow.

How to access the feature: Available during the Local Tax Accounting and Group Reporting process phases.

Additional features for Tax Losses for extraordinary operations and new restyled template

Why is it useful? Managing Tax Losses and Valuation Allowances during extraordinary operations—such as acquisitions, mergers, demergers, disinvestments, and other structural changes—can be complex. This enhanced functionality simplifies the process, ensuring greater accuracy. We've introduced a completely redesigned Tax Losses template, now featuring an integrated Losses Register for improved tracking and transparency. This update provides a more intuitive and structured approach to managing tax losses across various scenarios.

What can users do now? Previously, users had to build custom solutions. Now, this capability is available out of the box

How does this feature work? A new, ready-to-use template is available as part of the workflow.

How to access the feature: Available during the Local Tax Accounting process phase.

Management of Separately Taxed Income

Why is it useful? Set of new features to support the management of income subject to separate taxation, in line with local and international

tax regulations.

What can users do now? Previously, users had to build custom solutions. Now, this capability is available out of the box

How does this feature work? A new, ready-to-use template is available as part of the workflow.

How to access the feature: Available during the Local Tax Accounting process phase.

This document is only intended to highlight certain features of the latest Service Pack. For a full list of new features, please refer to the Service Pack Release Notes. For all technical details, please refer to the User Manuals.

About Wolters Kluwer

Wolters Kluwer (WKL) is a global leader in professional information, software solutions, and services for the healthcare; tax and accounting; governance, risk and compliance; and legal and regulatory sectors. We help our customers make critical decisions every day by providing expert solutions that combine deep domain knowledge with technology and services. Wolters Kluwer reported 2020 annual revenues of €4.6 billion. The group serves customers in over 180 countries, maintains operations in over 40 countries, and employs approximately 19,200 people worldwide. The company is headquartered in Alphen aan den Rijn, the Netherlands. Wolters Kluwer shares are listed on Euronext Amsterdam (WKL) and are included in the AEX and Euronext 100 indices. Wolters Kluwer has a sponsored Level 1 American Depositary Receipt (ADR) program. The ADRs are traded on the over-the-counter market in the U.S. (WTKWY).
