EIOPA - Solvency II Solution 22
Bank of England - PRA Solvency II Solution 22
Process Hub - DTP and “Load to AIH” Tasks 22

PLATFORM & CORE MODULES
Some Basic Info

Mandatory Activities after Updating

For the application to function properly, after each update it is necessary to run the deployment of roles from the Repository to ensure that any new feature included in the update is available. (Repository / Users and Roles / Users and Roles / Roles / Deploy).

User Manual availability

User manuals by version are available for download from the CCH® Tagetik Community website (https://community.tagetik.com/product/knowledge-base/user-manuals). Additional documentation on table structure for the Repository and CPM can be found in the downloads section of the application.

Highlights

New User Interface

Starting from CCH® Tagetik Version 5.3 Service Pack 27, a new UI has been made available for all users. As announced with bulletin n. 75, the CCH® Tagetik Legacy UI has been deprecated in CCH® Tagetik Version 5.3 Service Pack 30 and will be dismissed with CCH® Tagetik Version 5.3 Service Pack 36. Users should note the following:

- **New Navigation Pane:** all existing functionalities are accessible from the new UI using the new navigation panel (navbar), which replaces the legacy menu structure. A comprehensive mapping of legacy features to the new UI navbar is available in the online help;
- **New Homepage capabilities:** homepage capabilities have been enhanced to use widgets alongside the new navbar. Any type of customization done to the user's homepage (e.g., Bookmarks, Notes, Free content, Shortcuts, etc.) will not be automatically brought over to the Homepage of the new UI. Users, or Admins on their behalf, must redefine and set up the new Homepage from the enhanced widget types including Suggested Tasks, Bookmarks, Free Contents, and others. The background setting will be inherited from the Legacy UI and automatically applied.
- **Internal Documentation:** the change in the overall UI and navigation means that any type of documentation internal to the user's organization may require a rework.

For more information on the new CCH Tagetik user experience, the following resources are available:

Community page: https://community.tagetik.com/product/knowledge-base/bulletins/legacy-ui-dismissal
Bulletin no. 75: https://community.tagetik.com/library/bulletin-0075
Brochure: https://community.tagetik.com/library/brochure-cch-tagetik-enhanced-ui
Getting started with the enhanced UI video: https://community.tagetik.com/library/presentation-getting-started-with-the-updated-cch-tagetik-ui-webinar-1

Audit Data Migration Tool & New User Interface

Starting from Service Pack 18, users have been able to use the audit data migration tool to continue viewing legacy audit data within the audit windows. Up until Service Pack 33 (included), the tool could be launched by clicking the yellow banner in the legacy UI via the browser. As announced in bulletin no. 73 (available here: https://community.tagetik.com/product/knowledge-base/bulletins), starting from Service Pack 34, launching the audit data migration tool via the UI is no longer supported; it can now only be executed via API, using the following API endpoint:

“ <url API>/api/auditDataMigration/runJob?readInputSize=<n> ”

It is recommended to run the tool with n=10000 records, but the accepted range is from 1 up to 2^31 - 1.

Home Page

Shared Homepages

Admin users are now able to share any of the homepages they create with other users. The recipient users will see the homepages shared with them in read-only mode (with no possibility to make changes to content or layout). Any change to the homepage by the admin user will be automatically reflected in the user's view.

Improvements to Data Processing Panel

The Data Processing panel now lists all data processing triggered by the current user and in a separate section all those that are in progress and triggered by other users. It is also possible to view the detailed activities that each running data processing is performing in real time (via a pop-up). A counter of running data processing (current user vs other users) is also available in the System bar next to the button that opens the panel. The counters are also visible inside the panel next to the respective section titles. Finally, an overall visual redesign has been made to the objects inside the panel.

Data Model

Objective AI Enhanced with Deep Learning for AI Models

Service Pack 35 offers a new AI model based on Deep Learning, which enhances the existing ML technology for AI Anomaly Detection, AI Driver-based Analysis, and Predictive Intelligence. This Deep Learning technology provides users with one unified AI engine to forecast, analyze drivers, and detect anomalies with speed and consistency. The model can handle multiple KPIs and multiple variables simultaneously, even when historical series have different lengths, different granularities, and/or misaligned seasonality. This means that the model is able to adapt even when KPIs and drivers do not perfectly align with their historical series. One single model can perform forecasting, anomaly detection, and driver-based analysis without separate pipelines. It is trained once and serves all financial processes. By consolidating multiple analyses into a single model and pipeline, it reduces complexity, ensures coherent insights, and enables faster, more confident decisions across Finance, Operations, ESG, and Regulatory processes. Finally, the new model provides scalability for high-dimensional datasets: it can manage large rows ×accounts/dimensions combinations, multiple drivers and KPIs, and long histories.

Data Integration

Temporary Debug Partitions

Starting with Service Pack 35, the Data Transformation Package (DTP) Debug utility introduces a new option: “Temporary Debug Partitions”. This feature allows administrators to run DTP in debug mode and review data within each temporary partition when the “Context Independent Run” option is enabled. It is particularly useful for performing partial executions to analyze potential data issues or configuration errors in DTP settings.

Data Transformation Package: API

Starting with Service Pack 35, a change has been introduced to the function required for executing the Data Transformation Package API. Specifically, function “0003912” must be assigned in “enabled” mode to a user to allow the execution of the DTP API. If the function is assigned in “read-only” mode, the API cannot be executed. **Users should note** that some DTP API could need a rework to ensure that the “0003912” function is assigned in “enabled” mode and not in “read-only” mode.

Data Transformation Package with Ask AI

Starting from Service Pack 35, any specific metadata changes in the Analytical Workspace required for configuring a Data Transformation Package are now automatically synchronized by the system. This enhancement allows users to leverage Ask AI within DTP without the need for manual data synchronization.
Important note: manual synchronization is still required in cases where the environment or the Analytical Workspace is imported, or during Disaster Recovery operations (Analytical Workspace > action menu > Ask AI: sync DTP settings).

New Connector for Microsoft Fabric

A new native connector for Microsoft Fabric has been introduced in Service Pack 35, to enable seamless integration between CCH Tagetik and Microsoft Fabric. This enhancement allows users to directly connect to Microsoft Fabric to ingest datasets into CCH Tagetik, supporting both scheduled and on-demand data flows. The connector is optimized for enterprise-scale data volumes and is designed to streamline operations for customers already leveraging Microsoft ecosystem. Client secret authentication is supported for the connector.

Data Collection Process

Process and Workflow

Process Hub - Advanced Submission Functionalities

Starting from Service Pack 35, the following advanced submission functionalities have been migrated to the Process Hub for Processes which contain at least a step by Entity:

- “Exclude Other Calculation Logics from the data processing on submission”;
- “Diagnose all Steps before the submitted step”;
- “Also include the Stored Procedure”; and
- “Run jobs on submission and rejection”.

With these features, users who are migrating to the Process Hub can leverage these functionalities.

Comment Threads on Tasks in Process Hub

Service Pack 35 enables users to:

- add comment threads on tasks within the Process Hub list view;
- create, edit, and delete comments;
- benefit from threaded replies for structured discussions;
- add user mentions (i.e., @user) to notify and involve relevant team members;
- attach files within comments; and
- enjoy improved UI for seamless inline thread management without leaving the main view.

Advanced Filters

Users may now apply advanced filters for hierarchical elements in the Process Hub and select filtering logics that apply the selected filter to elements and their attributes. The advanced filters are supported across all organizational dimensions: Entity, Custom, and Analytical. Finally, Service Pack 35 has improved both usability and efficiency when navigating large or complex hierarchies.

Process Hub Improvements

The Process Hub has been improved as follows:

- Step Grouping
  - users now have the ability to group sequential conceptually similar steps;
  - graphical representation has been improved and UI is more compact; and
  - the need for scrolling in long processes has been reduced.
- Performance Dashboard – Absolute Values
  - a toggle between percentage and absolute values in the histogram has been added; and
  - the dashboard now displays the exact count of items per status (i.e., “Not started”, “In progress”, “Submitted”, “Rejected”, “Pending approval”).
- Open First in Progress Step
  - the process opening logic has been updated to automatically load the first step in “In Progress” status; and
  - the navigation efficiency has been improved, and manual searching is reduced.

Compatibility with Submission Notification

Process Hub restores full compatibility with Entity-level notification settings. It is now possible to configure email alerts triggered by Submission, Rejection, and Approval events. This enhancement ensures that users can once again leverage automated workflow notifications to maintain visibility, improve coordination, and streamline communication throughout the review cycle.

Accessing Journal Hub via Workflow Task

Service Pack 35 enables users to access the Journal Hub directly from the tasks. Specifically, by using the "Entity journals" task found in the “Data Entry and Reporting” section, users can open the Entity Journal Hub. Similarly, the "Consolidation journals" task within the same section will open the Consolidation Journal Hub.

Journal Header View

Service Pack 35 introduces a new feature within the Journal Hub for Entity and Consolidation: the Journal Header view. With this enhancement, users can now efficiently manage header attributes using the multi-selection option and run utilities across multiple journals simultaneously.

Automatic Numbering of Manual Journals

Service Pack 35 introduces the capability for the system to automatically generate journal numbers for manual journals. This option can be activated from the Journal Settings page, which is accessible via “Process and Workflow > Journal Rules > Default Settings link”. Upon clicking the link, a modal window opens and users now find a new option: “Journal Numbering Method”. If the selected value is “Manual”, users need to specify the Journal Separator and the Journal Prefix, as in previous service packs. If the selected value is instead “Automatic”, no further information is required from the user, and the journal number will be automatically composed as follows:

- For Entity Journals: the prefix "EJ" will be concatenated with the scenario code that the user is working on, the period code that the user is working on, and a sequential number.
- For Consolidation Journals: the prefix "CJ" will be concatenated with the scenario code the user is working on, the period code the user is working on, and a sequential number.

In both cases, the separator used to concatenate the parts that compose the journal number is "_". The sequential number is unique for Entity Journals/scenario/period and for Consolidation Journals/scenario/period.
Users should note the following restrictions with this feature: the prefixes "EJ" and "CJ" become unusable if entering journal numbers manually. It is not possible to recode journals that have been automatically generated by the system, and where possible, the use of the prefixes "EJ" and "CJ" is not allowed. It is also not possible to recode original scenarios for which there are journals with automatically generated numbers.

Delete Journal Functionality

Service Pack 35 significantly improves the Delete Journals utility in terms of functionality and traceability. Starting from this Service Pack, it is no longer possible to delete journals via the standard CRUD functions. Instead, this can be done via the dedicated function available in the “Utilities” menu of the Journal Management page. This utility operates at two different levels:

- if the journal has no related details (e.g., rows on original scenario, rows on consolidation scenario, documents, etc.), it can be deleted with access rights to the journals management page;
- if the journal has related details, its deletion is possible if the user has function “0001411” for Entity journals and function “0001412” for Consolidation journals in their role.

A journal can be deleted under the following conditions:

- when the Journal Submission functionality is enabled, the journal can be deleted only if has not been submitted;
- if the journal has no details, it can be deleted only if it does not belong to a submitted Entity at any steps of the process;
- if the journal contains rows, it can be deleted if the rows do not have preliminary or submitted origin; or
- if the journal contains rows, it can be deleted if the rows pass the editability checks.

The Delete Journal utility records both the numbers of deleted journals - ensuring traceability - and the numbers of non-deleted journals - along with the reason for the failed deletion - in the audit log.

Diagnostic

Ask AI Chat for Diagnostic

Service Pack 34 introduced the Ask AI chat for Diagnostic, which only supported execution conditions (e.g., “Only blocking errors”, “Update result log”, “Also show balanced data”, “Specific check”) and generic filters (e.g., “run on All entities”, “run on All Consolidator nodes”, “run on Consolidation scenario”).
Service Pack 35 expands the functionality to include dimension filters. Now, users can resolve filters for original and consolidation scenarios/periods, Entities, Entity hierarchies and nodes, categories and steps. For instance, users can now ask "Run diagnostic on entity CCH Tagetik" and Ask AI will identify and run diagnostic only for the Entity named CCH Tagetik. Similarly, users can now ask, "Validate Original data category," and Ask AI will identify the category named "Original data" and run diagnostic specifically for that category.

Consolidation

Consolidation of Investment (CoI) Report Enhancements

The consolidation of financial investments and net equity accounts is one of the most critical and complex steps in any statutory consolidation cycle. Introduced in Service Pack 34, the Consolidation of Investment (CoI) Report provides consolidators, sub-consolidators, and auditors with a comprehensive tool to track and monitor all information related to investment consolidation — from input data to elimination journals. The report is accessible from the Process Hub via the “Reports” button and has been further enhanced in this release. Key improvements include:

Contribution tab
A new tab that displays the evolution of data split by category for financial investment and net equity accounts. The table first shows the impact of Entity categories (Amounts and Entity Journals), followed by the impact of Consolidation Journals.
Consolidation Journals tab
This tab has been enriched. In addition to the financial investment elimination journal, the report now includes:

- Minority interest journals;
- Net equity reclassification journals; and
- Equity evaluation journals.

Owner Entities tab
Enhanced with additional information for improved visibility and analysis.

Ownership Structure Register tab
It now includes details related to exchange rates loaded for each event and/or event account, as well as net equity accounts converted into the owner's currency.

Graphical component for group structure
A visual component that displays the group structure filtered by the selected owned Entity.

Restatement

Restatement is an accounting process that allows retroactive modification of financial data already published or consolidated to reflect:

- changes in accounting principles;
- correction of material errors;
- group reorganizations (mergers, acquisitions, perimeter changes); and
- simulations of alternative scenarios (e.g., impact of different exchange rates).

CCH Tagetik already supports these scenarios; however, the new functionality introduced with Service Pack 35 provides a structured approach to manage data changes without altering the original version, ensuring traceability and comparability across scenarios where adjustments and integrations to data (balances and entries) are required.

Restatement is based on the management of scenarios:

- base scenario: the original version of the data;
- delta scenarios: one or more scenarios for corrections or integrations; and
- stacked scenario: an aggregated scenario automatically calculated as the sum of base and delta.

The functionality consists of two main components:

Restatement Template Definition: the definition of the template is available in the "Advanced Consolidation" section. The "Restatement Template" is introduced to link base, delta, and stacked scenarios, and it defines:

- base scenario;
- suffixes for delta and stacked scenarios;
- periods to process;
- linked consolidation scenarios; and
- option to update scenarios/nodes relationships.

When saving the template, the system automatically creates delta and stacked scenarios and periods (if not already existing).

Restatement Utility: this utility is accessible from the "Utilities" menu in the Process Hub, and it generates data in the stacked scenario as the sum of base and delta. Users have the following options:

- copy data: which transfers balances and entries from base and delta to stacked; or
- copy configurations: which replicates setup and parameters to delta and stacked scenarios.

The functionality is included in the Advanced Managerial & Statutory Consolidation Solution. For further details and the operational workflow, please refer to the User Manual.

Conversion at Historical Exchange Rate

Up until Service Pack 34, when converting accounts at historical exchange rates, the following behavior applied:

- if the parent account did not have the "Intercompany Management" option enabled, but one or more child accounts did, the system generated conversion rows with a "Ctp" Entity value;
- additionally, for FX rate difference accounts for Balance Sheet – Historical FX rates, the generated rows inherited the "Ctp" Entity value from the source rows, even when the FX rate difference accounts themselves had the Intercompany Management option disabled.

Starting with Service Pack 35, the conversion logic has changed:

- when the parent account does not have the "Intercompany Management" option enabled, conversion rows for historical exchange rate differences are generated without a "Ctp" Entity value, even if the child accounts have the "Intercompany Management" option enabled;
- similarly, FX rate difference rows are generated without a "Ctp" Entity value when the FX rate difference accounts for Balance Sheet have the "Intercompany Management" option disabled.

How to Preserve the Previous Behavior

To maintain the same behavior and data results as in Service Pack 34, it is necessary to enable the option "Intercompany Management" on the following accounts:

- parent accounts that must be converted at historical exchange rates.
- FX rate difference accounts for Balance Sheet, including both:
  - variation accounts, and
  - parent accounts.

Reporting and Disclosure

Reporting

New Configuration Parameters Available

Starting from Service Pack 35, the Report List processing has been aligned to the CCH Tagetik standard Remote Elaboration Framework. This change improves maintainability.

The following configuration parameters (in Repository > Data Processing) are available from Service Pack 35:

- "LAUNCH_REPORT_LIST_ELABORATION"
  Maximum number of Report Lists processed in parallel.

Default = “2”

- “REPORT_LIST_FORMS_CONCURRENT_ELABORATION”
  Maximum number of reports within a single Report List processed in parallel.
  Default = “4”

Billion Support in Reference Currency Settings

The application now accepts “1,000,000,000” as a reference currency coefficient without errors in “Dimensions > currencies > Currencies list”. The Reporting engine can now handle billions correctly.

"Wrap Text" Feature

The height of rows is now automatically adjusted in web forms when the option to wrap text is applied. This ensures that all cell content is fully visible without manual resizing. This enhancement extends the autofit behavior to additional form configurations, which improves readability and consistency. The enhancement also applies to forms that are not Line by Line, which were previously not covered by the row autofit logic. Users should note that row autofit is applied only when “Wrap Text” is enabled; manual row height changes made via the web interface are preserved if “Wrap Text” is not re-applied.

Dictionary Terms Defined Outside Matrices Now Supported

Dictionary entries defined outside a matrix are now correctly translated in web forms when the user changes the description language. Previously, these translations were only applied in the Excel Add-in. Translation handling is now aligned across platforms for:

- dictionary terms inside matrices;
- dictionary terms outside matrices;
- shared and non-shared dictionary entries.

This eliminates discrepancies previously observed between Web and Excel renderings.

AIH Web Forms Drill Down

Users can now explore the individual components that constitute an aggregated figure (drill down) in AIH forms on the web interface. With the standard drill down, users can add rows to the matrix, below the drilled element, starting from the AIH hierarchy node they belong to.

Currency Conversion – Period Length Based Aggregation

This release introduces a new currency conversion algorithm based on Period Length (i.e., “Aggregation of period length adjusted values”), designed to improve accuracy when working with data that is not monthly or not natively cumulative, such as quarterly, semi-annual, or irregular periods. Key benefits include:

- Accurate conversion for non-monthly data: conversion logic now aligns with the Period Length defined at Scenario/Period level, ensuring consistent results regardless of data granularity;
- Reliable YTD recalculation: values are recalculated starting from the current period, using YTD differences and the exchange rate of the current period, then re cumulated to produce correct converted totals;
- Full compatibility with existing exchange rates: all existing exchange rates are supported by the new algorithm, while the new rate “Average period length adjusted rate” applies only to the new algorithm.

Availability and limitations:

- available only for reports using the In-Memory reporting engine;
- currency conversion is not supported when the current period is earlier than the configured Period Length;
- the following functionalities are currently not supported:
  - Rates > FX Rates > Copy to Original Scenarios/Periods

- Rates > FX Rates > Cambi > Copy to Original Scenarios
- Process > Duplicate Process
- Process > Create backup on historical tables
- Process dashboard > Consolidated copy

Intelligent Disclosure

Ensuring Updated Data within Disclosure Documents

The newly introduced feature “Export differences” now validates that data is updated within disclosure documents. The system provides a comparison report between the document content and its source data (Excel or CCH Tagetik). This is how the new functionality works:

- it executes a full scan of the disclosure document;
- it compares each object against the latest source values; and
- it finally generates a detailed report listing any discrepancies.

This functionality is particularly useful when users need to confirm whether differences in their document are intentional, such as manual edits, or identify mismatches that require corrective action. This feature ensures accuracy and compliance while reducing manual effort.

Sharing to Adobe InDesign

Intelligent Disclosure now enables direct, automated sharing of Word documents to Adobe InDesign via SharePoint, which supports real-time collaboration between finance/ESG and design teams. Disclosure data in CCH Tagetik is instantly linked to InDesign layouts to allow for parallel updates and immediate synchronization. Designers receive live alerts for data changes to ensure that reports remain accurate and visually consistent.

Applying a Style Template

When applying a style template to a document, Intelligent Disclosure now considers not only the formatting rules but also the content included in the template itself. This ensures that any predefined text or structural elements embedded in the template are automatically incorporated in the document, which streamlines the creation process and maintains consistency across reports.

Special Approver Users

It is now possible to define special approver users in the Intelligent Disclosure Word AddIn. Special approver users can edit documents even when they are in “Submitted” status. Furthermore, the Rejection workflow behavior has been updated as follows: the document is no longer reassigned to the initial submitter, instead it is now routed directly to the first special approver user in the approval workflow. The review cycle efficiency has been improved by avoiding unnecessary resets to the starting point.

Intelligent Analytics

Reporting Views

It is now possible to create Reporting Views on AIH Datasets containing “Counterparty” (CTP) dimensions.

Dashboard

“by Account” Sign Change Option

The "by Account" sign change option is now available in the Dashboarding section for visuals that draw data from a Financial Reporting View.

Waterfall Charts

It is now possible to create waterfall charts in the Dashboarding section.

Pie Charts

It is now possible to create pie charts in the Dashboarding section.

Excel Add-in

Managing Format in Excel Pivots

The "Settings" button has been added to the Intelligent Analytics Excel add-in to manage settings for the current spreadsheet. The settings that have been implemented are custom cell styles to apply to pivots. These styles can be set at spreadsheet level, for all pivots, but also customized for each pivot.

Filtering a Pivot Table

The new "Keep Only" button in the toolbar enables users to quickly filter a pivot table to only show the selected elements.

Descendents and Lowest Options now Supported

The drill down function in CCH Tagetik Pivot now supports both descendants and lowest options, in addition to children. Users may also drill from specific items in rows or columns to focus on selected data, or drill directly from row and column titles for broader exploration.

Display Options for Pivot Elements

Users can choose what to show as row or column headers in a CCH Tagetik Pivot table. For each element in rows or columns, users can choose one of the following display options in the settings panel:

- Code: show only the element's code;
- Description: show only the element's description; or
- Code and Description: show both values concatenated.

The default option is "Description".

Functional Platform: Repository and Utilities

Password Caching Removed

In accordance with OWASP recommendations, password caching has been removed from the basic authentication login dialog.

New System Roles

For each solution purchased in a license, the system now provides two new system roles:

- **"$<SOLUTION>_ADMIN" role**: this includes all functions available within the solution, both Admin and Contributor types; and
- **"$<SOLUTION>_USER" role**: this includes all Contributor-type functions available within the solution.

When a license is uploaded with a new solution, the system now promptly adds the roles for the newly purchased solution.

API SCIM

Integration with Entra ID

Full support for SCIM APIs has been introduced to enable the integration with Entra ID (formerly Azure AD), and this includes the following enhancements:

- new property for emails and phone numbers: a new attribute type has been added to indicate the function of the contact information (e.g., "work" or "home"); and
- new multi-value query parameter: this parameter specifies the names of resource attributes to exclude from the default set of attributes returned. Attribute names must follow the standard attribute notation.

Backward compatibility: no changes are required for existing integrations; SCIM APIs remain fully backward compatible.

API SCIM

A new custom field has been added to store the list of allowed databases for users. This field includes the following details for each database:

- database code;
- database description; and
- locked status.

Extended Business Planning

Supply Chain Planning

Data Port for Improved Scalability of Supply Chain Planning Processes

Service Pack 35 improves the scalability of Supply Chain Planning (SCP) processed by introducing the ability to export and import the content of an instance. This enhancement enables several use cases, such as performing an instance promotion across environments, simplifying the automated backup by introducing the concept of restoring the SCP database from a previous data version, or copying the SCP database to a different tenant or database. Finally, this capability enables the creation of starter kits or solutions with predefined configurations, making the SCP process more accessible and easier to use within the CCH Tagetik platform.

Navigating Additional Objects Within Supply Chain Planning Workflow

The new version of the record view for the Supply Chain Planning process has been enhanced with the ability to navigate additional objects within the Supply Chain Planning workflow. This improvement provides an enhanced user experience by enabling seamless navigation across the newly introduced graphical elements (e.g., charts and reports), which now support fast and intuitive data entry. These enhancements simplify, streamline, and standardize the user experience across the CCH Tagetik platform for managing operational planning processes involving Supply Chain Planning.

Virtual Field Data

This feature provides Virtual Field specific UI controls determining if Virtual Field data is available for CPM query through the data integration pipeline. Users may find the UI in the SCP setup page with other Virtual Field properties. A subgroup of Virtual Fields is unable to be included in CPM query for security reasons and the UI is locked. For Virtual Fields that are eligible for CPM query, admin users can initiate CPM query availability in the Virtual Field properties dialogue box. This will initiate CPM query data visibility.

SOLUTIONS WITH PREDEFINED CONFIGURATIONS
Some Basic Info

The features listed below are compatible with CCH Tagetik Service Pack 35. As soon as they become available, the installation packages will be uploaded to CCH Tagetik Community website.

Transaction Matching

The below features are part of “Release 22”, scheduled to be available starting from February 23, 2026.

Input Set Transaction Monitoring Report

This new report allows continuous monitoring of the number of transactions loaded into the various Input Sets. It provides an average monthly value both year-to-date and year-end, supporting better volume tracking and planning.

Account Reconciliation

The below features are part of the “Release 22”, scheduled to be available starting from February 23, 2026.

Assignee User Replacement Tool

This tool enables the mass replacement of one user (Reconciler/Reviewer/Approver) with another user across reconciliation responsibilities. It is designed for cases where a user has been transferred or can no longer reconcile the accounts of a specific Entity or Division.

Reconciliation Group Definition Enhancements

The reconciliation group definition feature has been enhanced to give users more flexibility. Users can now choose to fully regenerate all rules from scratch or incrementally add or modify them, preserving any manual adjustments made previously.

Global Minimum Tax

The below features are part of the “R12” release, scheduled to be available starting from February 23, 2026.

Advanced GIR Reporting & XML Generator to Support OECD Compliance

This release delivers an enhanced framework for GIR reporting and XML configuration and generation, designed to offer smoother and more intuitive user experience while strengthening the alignment with OECD compliance requirements. The solution now automates additional data retrieval processes, expands system-driven mappings, and integrates an updated XML pre-configuration aligned with the most recent OECD schema, significantly reducing manual workload and the risk of inconsistencies. Users can now rely on extended GIR mappings that automatically capture a wider set of information—including attributes required for QDMTT calculations and the corresponding matrix population—thus minimizing manual data entry and improving reporting accuracy. On the XML side, the system delivers two major advancements: an updated standard pre-configuration that aligns with the latest OECD-GIR specifications, and the ability to upload local XSDs directly into the XML Generator — particularly useful for supporting local XML requirements such as QDMTT. Once the XSD is imported, the system automatically builds the corresponding XML structure with prepopulated tag names, providing a solid technical foundation for subsequent mapping activities.

These enhancements collectively streamline both reporting and filing processes, allowing users to work more efficiently and with greater reliability —whether adapting the GIR to local requirements or implementing QDMTT specific XML formats. Access to the features remains simple and consistent with the standard workflow: GIR Reporting is available in the Reporting phase, while XML configuration and generation can be accessed through the Filing phase.-specific XML formats.

EU Public CbCR: Aligned Configuration and Reporting Consistent with Official EU iXBRL Generator

The EU Public Country-by-Country Reporting (EUPCBCR) directive requires large multinational enterprises with global consolidated revenues above 750 million euro to publicly disclose key income tax information for each EU Member State in which they operate, as well as for non-cooperative tax jurisdictions. The goal is to increase tax transparency, enable public scrutiny, and show where profits are generated, and taxes are paid.
With this new feature, included in the CbCR process, users can quickly collect the data required for EU Public CBCR thanks to the functionality that retrieves information from the OECD CBCR step. Additionally, they can rapidly obtain reports that are fully compliant with the standard template proposed by the regulator, while also ensuring full data auditability. To enable time-dependent reporting required for the generation of the iXBRL file under the EU Public CBCR regulation, several enhancements have been implemented. In the Initialization step, it is possible to manage an ad-hoc perimeter for collecting information for EUPCBCR purposes by defining the list of countries that must be reported individually—rather than in an aggregated view—and by automatically populating the dedicated time dependent hierarchy.
On the reporting side, a new dedicated step has been set up, which includes functionalities such as: -hoc perimeter for collecting information for EUPCBCR purposes by defining the list of countries that must be reported individually—rather than in an aggregated view—and by automatically populating the dedicated time-dependent hierarchy.

- recycling the relevant information from the OECD CBCR step;
- allowing the upload of mass adjustments or the entry of adjustments via data-entry reports for both quantitative drivers and qualitative information;
- reviewing the accuracy of the collected information through a navigation report designed to support completion of the Official EU iXBRL Generator Template provided by the regulator.

Lease Accounting (IFRS16)

The below features are part of the “R29 SP06” release, scheduled to be available starting from February 20, 2026, and “R2.35” scheduled from February 27, 2026.

Abrupt Contract Termination Management

When a contract is abruptly terminated within the processing period, the system now triggers a dedicated modification event classified as early termination. Technical details are included in the Lease Account solution manual.

Tax Provision and Reporting

The below features are part of the “R8” release, scheduled to be available starting from February 23, 2026:

Enhanced Tax Content

New functionalities and reporting assets have been introduced to address users’ requests related to:

- **Detailed version of the Summary workpaper** at the Entity level, in addition to the drill-through capabilities;

- **Improved Tax Attributes and Credits**: the solution previously supported the management of offsets. With this release, the functionality has been expanded to include upward adjustments (additions). Users can now define whether these adjustments should impact the tax base or remain excluded, enabling more flexible and accurate tax calculation scenarios;
- **Enhanced IAS12 and ASC740 Disclosure Tax Reporting**, able to provide a comprehensive view of the Central Corporate Income Tax and the effects of Sub-central Tax; and
- **Enhanced Current Tax Reconciliation and Roll-forward**: the report layout has been streamlined, and both the current tax reconciliation and its roll forward have been added. This enhancement delivers a complete, year-by-year view of the current tax liability, from opening to closing balance.

Operational Transfer Pricing

The below features are part of the "R.02" release, scheduled to be available starting from February 23, 2026.

Allocation Rules Definition by Legal Entity

It is now possible to define allocation rules at the individual legal-entity level. This enhancement extends the logic previously available only at group level, enabling more granular control and better alignment with organizational structures. Rules can be configured by selecting measures, accounts, categories, and drivers specific to each Entity, ensuring greater precision and flexibility in the allocation process.

What-If Analysis Reports

New simulation analysis reports have been introduced, based on multiple snapshots and scenario comparisons. Users can now run quick OTP simulations and compare margins, allocation impacts, and overall results across different assumption sets using pre-built decision-support reports. This functionality enables proactive evaluation and supports TP forecasting and sensitivity analysis.

Intercompany Service Recharging

The first version of the intercompany service recharging feature is now available. This release introduces the foundational process for calculating and allocating service-related costs across group Entities, allowing cost distribution based on actuals or selected drivers. It represents the starting point for future enhancements and already enables coherent recharging flows within the OTP framework.

Non-financial Allocation Keys Definition

A new capability has been introduced to define and manage non-financial allocation drivers, such as FTEs, headcount, volumes, or other operational metrics. This feature allows users to enter, maintain, and leverage non-monetary data directly within the solution, enabling more accurate and business-aligned allocation processes. The collected drivers can be used in allocation rules to distribute costs or revenues based on operational dimensions, improving the precision of cross-entity allocations and enhancing the transparency of the OTP process. This enhancement expands the flexibility of allocation models and supports organizations that rely on operational drivers rather than purely financial drivers.

Accounts Machine Learning Auto-Mapping

A first version of intelligent Chart of Accounts auto-mapping has been introduced, powered by machine learning. The system now automatically suggests mappings between accounts of different entities, reducing manual effort and errors during data import and normalization. This functionality speeds up OTP model configuration and improves consistency across reconciliation and segmentation processes.

Production Cost Planning and Control

The below features are part of the "R19" release, scheduled to be available starting from February 20, 2026:

Trigger Data Processing without Prior Plant Selection

This feature enables users to trigger data processing (i.e., DTP) directly from reports that include this possibility, without needing to preselect a plant from the web interface via the workflow. During demos, or when running an already existing case in the system for the first time, the data processing can now be initiated from the report even if no plant has been selected. In these scenarios, the system will automatically execute the data processing for all plants available in the system that have previously been selected by any user via "plant selection" DTP, eliminating the need to navigate through the workflow to select them.

ESG & Sustainability Performance Management

The below features are part of the "Winter26" release, scheduled to be available starting from March 2, 2026.

Carbon Emissions

The following updates are included in this release:

- **Consolidation and Intercompany Eliminations:** it enables users to have a full visibility on applied company eliminations during consolidation processing;
- **New Emission Factor Databases ISPRA and AIB:** this introduces official ISPRA and AIB emission factor databases to improve accuracy and regulatory alignment of Scope 1 and Scope 2 emissions calculations; and
- **Centralized Emission Factor Database update:** it allows centralized updates of emission factor databases when structures remain unchanged, which significantly reduces configuration efforts.

EU Taxonomy

The following updates are included in this release:

- EU Taxonomy for Insurance and Reinsurance Undertakings:
  - New style sheet for Templates format.
- EU Taxonomy for Investment Firms:
  - Solution Regulation review based on Commission Delegated Regulation of January 8th, 2026 (Omnibus) 2 step: revision of automatic logics for new Templates.
- EU Taxonomy for Credit Institutions:
  - GAR Mapping enhancements
- EU Taxonomy for Non-Financial Institutions:
  - Changes in WBE partitioning;
  - Option to simplify DNSH and TECH criteria; and
  - Copy of Activity Registry and WBE Activity Mapping.

Bug fixing

This release includes bug fixing.

Solvency II Solution

The below features are part of the "Spring26" release, scheduled to be available starting from March, 6, 2026.

Bank of England – CCH Tagetik Liquidity Reporting for UK Insurers

This release includes a new module released to be compliant with new reporting framework (i.e., “PS 15/25”) issued by Bank of England PRA for major UK insurers.

IFRS17 Solution - Insurance Contracts

The below features are part of the “WINTER2025” release, scheduled to be available starting from February 27, 2026.

Compatibility with CCH Tagetik Intelligent Disclosure Solution

Intelligent Narrative documents can now also be created with the IFRS17 solution, by integrating “IFRS17 Disclosure” and/or Custom reports directly into the notes and textual sections. Users can produce automated narrative documents with generative AI thanks to the integration with Microsoft Copilot.

Performance Improvements

This release introduces performance improvements by replacing complex SQL-based logic with standard CCH Tagetik functionalities. This transition streamline processes and ensures a more robust execution environment. Specifically, processing times when adopting the "Shifted Yield Curve" discounting methodology have been reduced, optimizing overall calculation performance.

Bug fixing

This release includes bug fixing.

iXBRL software (powered by CoreFiling)

The below features are part of the 1.93.1 iXBRL Solution version (or higher) release, scheduled to be available starting from February 13, 2026.

ESMA ESEF Reporting Manual – Latest Updates

The platform now incorporates the most recent updates issued by ESMA, ensuring full alignment with the latest version of the ESMA ESEF Reporting Manual.

Enhanced Table Detection and AI-Driven Auto-tagging

Improved table-recognition algorithms, combined with a strengthened AI engine, deliver more accurate reconstruction of table structures and more precise tag suggestions and auto-tagging.

Automatically Add and Order Concepts in the Presentation Tree

The platform can now automatically add and correctly order taggable concepts derived from tables within the presentation tree, ensuring that the hierarchy reflects the exact structure of the tagged table.

Improved Visualization of Text Block Content for Export Files

Page break and continuation processing has been enhanced. For each page, the platform highlights the specific portion of text associated with the corresponding tag in both the review spreadsheet and the migration report exports.

EBA – Consolidated FinRep

The below features are part of the EBA – Consolidated FinRep “Winter25” release, scheduled to be available starting from February 13, 2026.

New module: EBA - Consolidated FinRep

This is a fully integrated FinRep regulatory reporting module, exploiting the CCH Tagetik Financial Close and Consolidation solution. The FinRep Solution follows what is required by the EBA Reporting Taxonomy perspective (Regulation (EU) 2015/534 of the European Central Bank).

Appendix

Solvency II Solution

EIOPA - Solvency II Solution

This solution has yet to be released on Service Pack 35. Users should note that the recommended minimum release is 5.3.34, as this version has been tested for this specific solution. The Solvency II Solution version “Spring26” scheduled to be released on March 6, 2026, will be compatible with CCH Tagetik version 5.3.34.

Bank of England - PRA Solvency II Solution

This solution has yet to be released on Service Pack 35. Users should note that the recommended minimum release is 5.3.34, as this version has been tested for this specific solution. The Bank of England - PRA Solvency II Solution version “Spring26” scheduled to be released on March 6, 2026, will be compatible with CCH Tagetik version 5.3.34..

Process Hub - DTP and “Load to AIH” Tasks

Overview and Main Functionality

Since Service Pack 22, it is possible to run DTP tasks and “Load to AIH” tasks from the Process Hub in both list and workflow mode. Specifically, the DTP tasks can only be run in “Context Independent mode” and the “Load to AIH” tasks are restricted to writing only on the Reporting layer. The run of the task is filtered contextually based on the element selected in the Process Hub for the current step. If users run DTP or “Load to AIH” tasks from a Form, they must first ensure that the report includes the Entity dimension. It is possible to run a DTP task in single selection mode. DTP tasks without parameters can be run freely, while DTP tasks with parameters contain several limitations which are listed below.

Current Limitations

Below is a list of current limitations:

- parameter pre-valorization is not supported: users must insert the parameter value each time the processing is run;
- parameter default mechanism is not supported; and
- all the Reporting parameter types are supported, except for: "Advanced Financial Statement Template" and "Standard financial statement template".

With regards to the Reporting parameters of type "dimension", the following limitations must be considered:

- only parameters defined on the following dimensions are currently supported: "Entity", "Analytical Dimension", "Custom Dimension", "Scenario";
- given a Reporting parameter defined on one of the above listed dimensions, all the hierarchies (or groupings) defined by the user for that specific dimension are shown in the look up for the selection of the parameter values. The definition of the parameter in terms of "explicit restrictions" or "advanced selection" options are not supported;
- “Flat”, “Time dependent” and “Geographical” hierarchies are not shown;
- for each hierarchy/grouping in the look up, all nodes and elements are shown (the "allow lowest level elements/node" option in the definition of the parameter is not supported);
- dependent parameters are not currently supported; and
- Process restrictions are not currently supported.
