Copy Consolidated Amount on Original Amount 8
Seamless Workflow Experience 8
Data Entry 8
Create New Dimensional Elements directly from a Data Entry Form 8
Journal Hub Visual Indicators 8
Journal Hub New Filter 8
Journals Hub Evolution - Header Panel by Category 9
Accessing the Intercompany Cockpit via Diagnostic Results 9
Diagnostic 9
New Filter Criteria 9
Consolidation 9
Ownership Structure Register Navigation Enhancements 9
Restatement – EPU and Control Chart Compatibility 9
Rules Engine Designer – Variation Type as Output Dimension 10
Rules Engine Designer - New Conditions Based on IFRS 5 Events 10

Rules Engine Designer – Account Dynamic Groups in Input Dimensions 10
Rules Engine Designer - Periodic Data Processing on Original Scenario 11
Journal Hub - New Consolidation Scenarios Filter Utility 11
Intercompany Cockpit – New Intercompany Status Management 12
New IC Status management 12
New IC Status storage 12
New IC Status Activity Log 13
Reconciliation of Unbalanced Relationships 13
Reporting and Disclosure 13
Intelligent Disclosure 13
PowerPoint Add-inn – Document Parts 13
Word Add-in - Document Parts Search and Workflow Visibility Enhancements 13
Word add-in - Filter Document Parts by Status and Assigned Actions 13
Word Add-in Validations - Table Totals 14
Word Add-in Roll Forward – User Rights and Workflow Configuration 14
Word Add-in Import configuration 14
Word Add-in Superscript Conversion for Footnotes 14
Word Add-in Workflow Actions Report 14
Functional Platform: Repository and Utilities 14
Audit Log Enhancements 14
Intelligent Analytics 15
Excel Add-in 15
Filter Panel Search 15
Additional Drill Down Options 15
Subtotals in Pivot Tables 15
“TGK.DISPLAY” Formula Display Options 15
Objective AI 15
New Version of Deep Learning for Anomaly, Forecast, Analysis* 6.0.1 15
Extended Business Planning 16
Supply Chain Planning 16
Checkmark Column 16
SOLUTIONS WITH PREDEFINED CONFIGURATIONS 17
Some Basic Info 17
Account Reconciliation 17
Account Reconciliation Dashboard 17
Comments Integration within Account Reconciliation Cockpit 17
Editable Grid View 17
Custom Reconciliation Frequency Definition 17
Templates Assignment Rules Enhancements 17
Operational Transfer Pricing 18
Additional Margin Calculation and Monitoring Level (Entity – TP Function Level) 18
Possibility to Manually Segment “Unassigned” Transactions 18
Enhancements to Segmentation Engine 18
Dynamic Benchmark Adjustments Management 18
Benchmark Definition at Entity Level 19
Calculation Details Report 19
Price Setting (Use Case) 19

Global Minimum Tax 19
GIR Compliance Enhancements and Correction Filing Improvements 19
Tax Provision and Reporting 20
Deferred Tax Scope Management 20
Equity and OCI Balance Tracking Enhancement 20
Lease Accounting (IFRS16) 20
Deferred Tax Rate Table and Deferred Tax Rate Adjustment 20
Contract Creation Date Added to “V21_033” Modification Report 20
Configurable “ASSET_VAR” Handling for Transfer Events 20
ESG & Sustainability Performance Management 21
Introduction of Scenario/Period-Based Consolidation Configuration 21
Omnibus: Integration of Dedicated Control Groups 21
Omnibus: Output Disclosure Review 21
Data Entry Change Log 21
Ready-to-use Standard Omnibus 21
GRI Updates: 102 – Climate Change 2025; 103 – Energy 2025 21
EU Taxonomy 21
ESG Planning & Analytics Accelerator 22
ESG Carbon Emissions 22
Driver for Configurable Data Entry Forms 22
New Pre-configured Emission Factors Library 22
Solvency II Solution 23
EIOPA – Solvency II Solution 23
Bank of England - PRA Solvency II Solution 23
New Module: IRRD – EIOPA Insurance Recovery and Resolution Directive Solution 23
IFRS17 Solution - Insurance Contracts 23
Bug Fixing 23
iXBRL software (powered by CoreFiling) 23
New Features 23
EBA – Consolidated FinRep 24

PLATFORM & CORE MODULES
Some Basic Info

Mandatory Activities after Updating

For the application to function properly, after each update it is necessary to run the deployment of roles from the Repository to ensure that any new feature included in the update is available. (Repository / Users and Roles / Users and Roles / Roles / Deploy).

User Manual availability

User manuals by version are available for download from the CCH® Tagetik Community website (https://community.tagetik.com/product/knowledge-base/user-manuals). Additional documentation on table structure for the Repository and CPM can be found in the downloads section of the application.

Highlights

Removal of "Encrypt .NET (Deprecated)" Flag

As announced in bulletin 86, starting from Service Pack 37, the "Encrypt .NET (Deprecated)" flag is permanently removed. This means that the flag will be disabled by default, and no longer configurable. The feature, which had already been deprecated, is now being fully removed to prevent potential issues affecting the login process of Microsoft .NET Add-ins (i.e., Excel, Word, and Power Point). For reference, when enabled, this flag was used to encrypt messages exchanged between the Add-in and the server. No action is required from Service Pack 37 onward, as the flag is automatically disabled and no longer available. For additional information, please see bulletin no. 86 available here: https://community.tagetik.com/product/knowledge-base/bulletins

Modernization of Authentication Technology in Microsoft Office Add-ins (Excel, Word, PowerPoint)

The modernization of authentication technology in Microsoft Office Add-ins starts from Service Pack 37, as announced with bulletin no. 88, which informs users of an upcoming enhancement to the technology used for the communication client-server that includes the authentication used across CCH Tagetik Microsoft Office add-ins, Excel, Word, and PowerPoint. As part of CCH Tagetik's ongoing commitment to innovation, security, and long-term platform sustainability, the current login technologies based on Internet Explorer and CEF Sharp will be progressively phased out over the next 12 months. These legacy components will be replaced with a modern authentication engine based on Microsoft WebView2, a fully supported technology built on Microsoft Edge (Chromium). Additional information on this topic is available here: https://community.tagetik.com/product/knowledge-base/bulletins

Reminder of Dismission of CCH Tagetik Legacy Database Consolidation Engine

Starting with the release of Service Pack 30 in November 2024, the launch of consolidation data processing with the Legacy Database Consolidation Engine setting enabled has been supported only for existing processes and remains available until the release of Service Pack 38 in November 2026 (not included). Starting from Service Pack 38, any data consolidation processing (i.e., new or existing) must be launched using the In-memory Consolidation Engine. For additional information, please see: https://community.tagetik.com/product/knowledge-base/bulletins/dismission-legacy-database-consolidation-engine

Data Model

Machine Learning Training & Execution Tasks

Machine Learning training and execution tasks can now be run in the Process Hub within Custom Dimension phases. Users should notice that this feature is currently supported only for the Reporting layer and that BC&E partitioning is not supported.

Deployment

API Support for Consolidation Scenarios and Scenario/Period Matching

New APIs enable external systems to retrieve, create, update, and delete scenarios, matching definitions, and related attributes directly within the CCH Tagetik data model.

API Support for Managing Account Hierarchies

New APIs enable external systems to retrieve, create, update, and delete account structures, hierarchical nodes, and account-to-node assignments directly within the CCH Tagetik data model, simplifying the maintenance and integration of chart of accounts configurations.

APIs Support for Managing Entity Hierarchies

New APIs enable external systems to retrieve, create, update, and delete Entity structures, hierarchical nodes, and Entity-to-node assignments directly within the CCH Tagetik data model, simplifying the maintenance and integration of organizational hierarchies.

Configuration Deployment Tool: Schedule Transfers between Environments

Users can now schedule transfers in the Configuration Deployment Tool instead of starting them manually at the time of execution. This means that users can:

- schedule a transfer by setting a specific date and time;
- configure the transfer with filters;
- apply deletion policy settings as part of the scheduled run;
- create recurring schedules; and
- monitor scheduled and executed jobs in the “Scheduling area” of the CPM.

Data Integration

Intelligent Data Loader (IDL): Bi-Directional Integration with Cloud Data Platforms

Service Pack 37 introduces the evolution of the Intelligent Data Loader (IDL), a next-generation data integration framework designed to enable bi-directional data exchange between CCH Tagetik and leading cloud data platforms. With this enhancement, the IDL supports both data ingestion into CCH Tagetik and data write-back from CCH Tagetik to supported platforms, including Databricks, Snowflake, Microsoft Fabric, and Google BigQuery. This new capability enables users to seamlessly move data across their analytical ecosystem. For example, users can extract data from a CCH Tagetik Analytical Workspace and then write back directly to their preferred cloud data platform for further analytics, reporting, AI, or data sharing use cases.

Intelligent Data Loader Workflow Task

A new workflow task for the Intelligent Data Loader (IDL) is now available. The task allows users to execute previously saved IDL configurations directly from CCH Tagetik workflows, enabling the orchestration of data integration processes within business workflows. The feature is supported in both the Process Hub and the Legacy Cockpit.

Snowflake Connector – Configurable Write-Back Payload Size

The Snowflake connector includes a new advanced setting that allows users to define the maximum payload size for write-back API calls. During write-back operations, large datasets are automatically split into multiple requests according to the configured threshold, providing greater flexibility and control when transferring data to Snowflake. A recommended default value is provided to simplify configuration.

REST Connector – Advanced JWT Authentication Support

The REST Connector enhances the OAuth 2.0 Client Credentials authentication by using JWT signed with a private key. Users can now select the JWT signature algorithm from a list of supported standards (including RSA, EC, PS, and EdDSA algorithms) and configure additional custom JWT claims directly in the endpoint definition. These enhancements increase interoperability with external APIs and identity providers requiring specific JWT token structures.

AIH Export/Import – Comments and Attachments

AIH Export/Import now supports the migration of comments and attachments associated with Analytical Workspace content. Users can choose whether to include comments and attachments during export and import operations, making it easier to preserve business context and supporting documentation when moving content across environments.

EBA XBRL-CSV Currency Management

Service Pack 37 includes an improvement introduced to ensure compliance with EBA requirements for XBRL-CSV file generation. Specifically, when no monetary information is reported in the XBRL-CSV output, the parameters.csv file no longer includes the default currency information.

Data Collection Process

Process and Workflow

Process Hub Improvements

This release includes several improvements to Process Hub:

- Set Form as web-only in workflow: when defining a workflow in admin mode, it is now possible to define a form as web only. In this case, the "Open as Excel" option will not be available to the users.
- View Code in list of form view: when the list of form view is opened, the code of the forms will be displayed together with their descriptions.

Submit and Reject Multiple Steps

It is now possible to carry out submission and rejection activities on multiple steps for the same dimension. When running the submission, in cases where the user has the appropriate user rights, the submission will run for all steps on the same dimension that precede the select step. In a similar manner, the rejection will be carried out for all subsequent steps for the same dimensions. When the data processing terminates, the user will be notified of the end of the submission or rejection with an indication of success, failure, or warning.

Email and General Improvements

Users may now configure and send an email when an element in any dimension is approved or submitted. Furthermore, consolidation method options within the advanced filtering modal popup are now set to “all true” by default.

DTP Tasks

Administrators can now define a DTP task within a List step. This allows task management users to leverage all operations offered by the DTP engine.

Copy Consolidated Amount on Original Amount

The “Copy consolidated amount on original amount” modal popup is now available for the Process Hub as well.

Seamless Workflow Experience

The Seamless Workflow has been designed to significantly enhance the user experience by making content navigation faster, more intuitive, and more efficient. Users can now keep their assigned task list constantly visible, which enables immediate access to pending activities and helps manage priorities more effectively. At the same time, users can seamlessly browse related content without disrupting their workflow. At the top of the screen, the key task information is always displayed, ensuring that users have immediate access to the operational context while navigating through forms, data, and reports. For activities that require greater focus, a full screen mode is also available, providing maximum workspace and an optimized viewing experience. Another key advantage is the advanced navigation between forms and reports. Reports can be opened directly through contextual links and remain easily accessible throughout the user session. A dynamic breadcrumb navigation bar displayed in the header clearly shows the sequence of opened forms, helping users maintain full visibility of their navigation path. Additionally, all open reports remain available and easily navigable. Users can quickly switch back to any previously accessed report without the need to repeat searches or retrace navigation steps, ensuring a smooth and uninterrupted working experience.
Users should note that the seamless workflow experience is not available for: "list" type tasks (task manager) and windows containing other windows (list of forms, diagnostic results log, etc.)

Data Entry

Create New Dimensional Elements directly from a Data Entry Form

It is now possible to create new dimensional elements directly from a Data Entry form, streamlining the process during planning and data collection activities. Traditionally, creating a new member required an administrator’s intervention to define the element in the master data, assign it to hierarchies, and configure user permissions. With this enhancement, authorized users can simply right-click on an existing element within the Data Entry form and open a guided panel to create a new one by only entering a code and description. The new element automatically inherits the properties of the selected reference item, including hierarchy assignments and user rights. Once created, it is immediately available in the Data Entry form and can be used for data input without any additional configuration steps. This feature is particularly useful during budgeting or forecasting processes, where new Entities (such as products) may need to be introduced on the fly and populated with data right away. Finally, users should note that this functionality is controlled by a dedicated user role permission.

Journal Hub Visual Indicators

The Journal Hub now provides visual indicators that help users immediately identify the origin of journal rows. As already available for other Data Entry, journal rows can now be differentiated according to their origin. A dedicated color indicator is displayed in the “Info” column, allowing users to quickly recognize how each row was generated.

Journal Hub New Filter

The Entity Journals and Consolidation Journals dashboards available via the Journal Hub have been enhanced with a new filtering option that helps users focus their analysis on journals containing at least one manual row. To this end, a

new filter has been added - “Only Journals with Manual Rows” - to the driver selection panel. When enabled, dashboard statistics are calculated exclusively on journals that include at least one manual row.

Journals Hub Evolution - Header Panel by Category

The Journal Hub has been enhanced to provide greater flexibility when browsing journal entries. In addition to the traditional flat list view, users can now organize and display journal headers grouped by category using a new display option in the list of journal panel that enables users to switch between the flat list and the category-based view.

Accessing the Intercompany Cockpit via Diagnostic Results

Starting from this release, users can directly access the Intercompany Cockpit from the Diagnostic results when unreconciled intercompany balances are detected. Previously, users had to manually navigate to the Intercompany Cockpit after identifying reconciliation issues through the Diagnostic process. With this enhancement, the reconciliation workflow becomes more streamlined and intuitive.

Diagnostic

New Filter Criteria

Service Pack 36 introduced Account Dynamic Groups as a new way to define groups of accounts dynamically, based on configurable rules rather than static selections. Service Pack 37 further improves the feature by adding new filter criteria. Specifically, available criteria now include:

- FST Item
- Variation/Detail type
- Grouping of Variation/Detail type

Consolidation

Ownership Structure Register Navigation Enhancements

To improve navigation and streamline the consolidation process, new links have been added within the Ownership Structure Register (OSR).

- Consolidation Areas Navigation: users can now navigate directly from the OSR to the Consolidation Areas list through a dedicated link available within the OSR interface; and
- Periodic Minorities Configuration Navigation: when periodic minorities are enabled for the current process, users can also access the “Setup Periodic Minorities Calculation” page directly from the OSR through a dedicated link.

This feature provides a better integrated user experience by maintaining the current process context when moving between OSR, Consolidation Areas, and Periodic Minority Configuration pages.

Restatement – EPU and Control Chart Compatibility

Starting with Service Pack 37, the Restatement feature is fully compatible with both Equity Pick-Up (EPU) data processing and the Control Chart functionality, extending support to consolidation processes that rely on these features. For projects using Equity Pick-Up, the Restatement process previously copied the EPU configuration tables but did not execute the related EPU deployment process. Starting with this release, the EPU deployment is automatically triggered as part of the Restatement execution, ensuring that EPU data is fully recalculated and aligned with the restated data. This enhancement provides a more consistent and complete restatement process for EPU-enabled projects.

Rules Engine Designer – Variation Type as Output Dimension

The Variation type as output dimension feature is available in the definition of output dimensions for the Rules Engine Designer (RED) rules, both in the original scenario and in the consolidation scenario. This option enables users to control the variation type associated with the output account, offering four operating modes: “Do not handle”, “Set specific variation type”, “Same as input”, and “Set from control group”.
With this enhancement, users can configure not only the account but also the variation type selection criteria directly within the rule. This results in greater flexibility in rule modeling, a significant reduction in the time required to implement new rules and maintain existing ones, and a lower risk of rule misalignment.
When the variation type selection is set to “Do not handle”, the system behaves exactly as in the previous version. By selecting “Set specific variation type”, users can specify a variation type that will always be applied to the output account. With “Same as input”, the variation type from the source account is automatically copied to the destination account. Finally, with “Set from control group”, the variation type is determined based on the variation type configured in the control group to which the accounts belong. The system automatically validates the compatibility between the output account and the selected variation type. If no valid match is found, the line is not generated.

This update is backward compatible. All existing rules will continue to function as before, as the default value of the new option is “Do not handle”. No immediate action is required from users. However, it is recommended to review existing rules to identify cases where the new variation type selection options could simplify rule definition and reduce maintenance needs.

Rules Engine Designer - New Conditions Based on IFRS 5 Events

This release introduces new filter conditions in the Rule Engine Designer (RED) that allow users to drive calculation rules based on IFRS 5 events — the accounting standard that governs assets held for sale and discontinued operations. Users can now define rules that automatically activate or deactivate based on the IFRS 5 status of an Entity. Specifically, it is now possible to set conditions based on the following types of operation:

- Sale Approval: the Entity has been approved for sale;
- Revoke Sale Approval – the sale approval has been withdrawn; and
- Sale – the Entity has been sold.

For each condition, users can also specify whether the Entity is classified as "held for sale" and/or as a "discontinued operation", giving greater flexibility in how rules are applied across different scenarios. The system evaluates the most recent IFRS 5 event recorded for each Entity and checks whether it matches the selected criteria. Rules can be applied to both original and consolidation scenarios, ensuring that financial data is processed correctly throughout the entire lifecycle of an IFRS 5 event — from the initial sale approval through to the final sale or revocation. This enhancement makes it easier to automate IFRS 5 reclassification logic directly within the consolidation engine, thus reducing need for manual adjustments.

Rules Engine Designer – Account Dynamic Groups in Input Dimensions

Account dynamic groups, introduced in Service Pack 36, enable the dynamic definition of account sets based on configurable criteria rather than static selections. Starting from Service Pack 37, by leveraging this capability within RED rules, users benefit from the centralized management of account groups and improved consistency across configurations, while ensuring automatic alignment with changes in account definitions. The “Account Dynamic Groups in input dimensions” feature is available in the definition of input dimensions for RED rules, both in the original scenario and in the consolidation scenario. This option allows users to select a dynamic group of accounts as an alternative to the traditional selection by single account or hierarchy node. When using dynamic groups in input dimensions, the system resolves the group automatically at runtime, including all accounts matching the configured criteria. Alternatively, users can continue to define input accounts using traditional methods (individual accounts or hierarchy nodes), ensuring full flexibility in rule configuration. With this enhancement, users can define input account selection more efficiently directly within the rule. This results in simplified configuration, reduced manual effort, and improved scalability when defining and updating RED rules.

The update is backward compatible. All existing rules will continue to function as before, as no changes are applied to current configurations. No immediate action is required from users. However, it is recommended to review existing rules to identify cases where the use of account dynamic groups could simplify rule definition and reduce maintenance effort.

Rules Engine Designer - Periodic Data Processing on Original Scenario

The use of Periodic Consolidation is increasingly spreading across the financial ecosystem, as it provides a more accurate reflection of fiscal year events in relation to the historical evolution of the group structure. The periodic RED offers greater flexibility by enabling users to independently manage rules to meet specific business requirements. Starting from Service Pack 34, the periodic RED was available on the consolidation scenario only; now periodic rules are configurable on the original scenario as well.
Typically, the periodic option is used in combination with the dynamic markup feature. Users can define whether to apply the periodic or year-to-date calculation approach. Periodic calculation allows for more accurate amounts when the dynamic markup is present. Additionally, it enables the generation of variation flows due to changes in rule application compared to the previous period. The available options are:

- Year-to-date: it calculates the year-to-date amount for the processing period, by applying the dynamic markup defined for that period. This is the default option and the option for existing rules;
- Periodic – Start of Period: it calculates the periodic amount on which to apply the dynamic markup. Changes in the dynamic markup or rule application compared to the previous period are considered to have occurred at the beginning of the period;
- Periodic – End of Period: it calculates the periodic amount on which to apply the dynamic markup. Changes in the dynamic markup or rule application compared to the previous period are considered to have occurred at the end of the period.

The following rows are generated during periodic calculation:

- Period Quota: the difference between the amount of the current processing period and the previous period. (This calculation is performed even if data for the current period is missing). The dynamic markup is applied as follows:
    - Start of Period: dynamic markup of the current processing period;
    - End of Period: dynamic markup of the previous period.

- Copy from Previous Period: starting from the second period of the scenario, the rows generated in the previous period are copied;

- Dynamic Markup – Variation from Previous Period (only if configured):
    - Start of Period: parent account amount from the previous period × delta markup;
    - End of Period: parent account amount from the current processing period × delta markup.

Rows generated by periodic calculation can be identified by the content of the “Notes field”, which includes the label “[Periodic]”

Journal Hub - New Consolidation Scenarios Filter Utility

The Consolidation scenarios filter is a newly available utility to assign one or more consolidation scenarios to selected journals in a fast and controlled way. The utility can be accessed from the “Utilities” menu within both Entity Journals and Consolidation Journals (Management and Headers views), and it allows users to centrally manage consolidation scenario filters on multiple journal headers. With this feature, users can select and assign multiple consolidation scenarios to the selected journals and control the application behavior through dedicated options:

- "Exclude next scenarios" to prevent the propagation of the filter during the carry forward data processing; and/or
- "Override existing filters" to replace previously defined scenario filters.

During the execution, the system validates the selected journals to ensure consistency and automatically only applies scenarios that are compatible with the consolidation rules. The processing updates the journal configuration by inserting the selected scenarios and activating the Consolidation scenarios filter flag on the journal header, ensuring that the filter becomes effective immediately.
This enhancement improves efficiency and governance in managing consolidation scenario applicability across journals, reducing manual effort and ensuring consistency with consolidation rules.

Intercompany Cockpit - New Intercompany Status Management

The Intercompany Cockpit (IC) status management has been redesigned to provide a fully relationship-based status management model, improve auditability, and simplify status tracking through a more detailed activity history.

New IC Status management

The following status management activities are available:

- Intercompany insertion is completed;
- Intercompany insertion in progress (activity available only after data entry IC completion);
- Lock intercompany data for submission (available when both companies have completed IC data entry);
- Unlock intercompany data (available until the relationship has been reconciled);
- Submit intercompany data (available only when the counterpart company has already locked the relationship); and
- Reject intercompany data (available only after reconciliation and only for consolidator users).

In earlier versions, the "Intercompany insertion is completed" and "Intercompany insertion in progress" activities were performed at Entity level, affecting all relationships belonging to the selected Entity. All other status changes worked at relationship level. With this release, all activities are relationship-based, ensuring that only the selected relationship is impacted by each status change. It is important to notice that users who still require the previous Entity-level behavior can achieve the same outcome by using “Multiple Actions”.

New IC Status storage

To support this new behavior, the IC status storage model has also been redesigned. In previous versions, the IC status was stored in two separate tables:

- Entity-level status table (table name “LOG_CRUSCOTTO_IC”)
- Relationship-level status table (table name “LOG_CRUSCOTTO”)

These tables have been replaced by a new unified storage model. A migration script transfers existing data to the new structure during the upgrade process. Users should note that during the migration, some Entity-level statuses may not be transferred for Entities that do not have at least one corresponding relationship-level activity recorded. This approach avoids the excessive overhead of generating all potential relationships during the upgrade process. The legacy tables are retained for audit and compliance purposes. Users who require the recovery of these Entity-level statuses may request a dedicated migration script.

Users with custom ETL, Stored Procedures, reports, or other customizations that directly access the legacy tables (“LOG_CRUSCOTTO_IC” and “LOG_CRUSCOTTO”) should review their implementations. Although the tables remain available for audit purposes, they are no longer updated by the application and should not be considered the source of the Intercompany Cockpit status.

New IC Status Activity Log

This redesign introduces a more detailed and accurate activity log for enhanced auditability. With the redesigned status management, users now benefit from:

- detailed tracking of all relationship status changes;
- improved visibility of relationship lifecycle events; and
- Excel export support.

Additionally, relationship activity logs can now be accessed not only through the existing “Show Relationship Activities” menu available for a specific relationship, but also through a new report menu providing a consolidated view of all relationship activities within the selected Intercompany Cockpit.

Users should note that historical activity records cannot be migrated to the new activity log view. Activities recorded before the upgrade will remain available through standard audit queries but will no longer be displayed in the “Show Relationship Activities” menu.

Reconciliation of Unbalanced Relationships

When a consolidator executes a reconciliation of unbalanced relationships, previous versions displayed a confirmation dialog box which listed all affected relationships. This detailed list is no longer displayed. Consolidators are informed that proceeding may reconcile relationships, even when differences still exist. Unbalanced relationships are explicitly recorded in the resulting audit trail with the reconciliation logic details.

Reporting and Disclosure

Intelligent Disclosure

PowerPoint Add-inn – Document Parts

Intelligent Disclosure extends the PowerPoint add-in to support document parts, introducing a more granular control of user access and responsibilities within presentation documents. Document parts can now be defined directly within PowerPoint slides, enabling organizations to segment content into logical sections and assign specific permissions to different users or user groups. This enhancement allows administrators to segregate responsibilities across contributors by controlling who can view or edit specific portions of the presentation. As a result, sensitive information can be restricted while ensuring that each user can focus on their assigned sections. By leveraging document parts, the solution strengthens governance, improves collaboration across teams, and ensures better compliance with internal control requirements.

Word Add-in - Document Parts Search and Workflow Visibility Enhancements

Intelligent Disclosure enhances the document part management by improving navigation and workflow visibility. Users can now search document parts by name directly from the outline, making it easier to quickly locate specific sections within complex documents. Additionally, the document library now provides visibility into the workflow status of each document root, allowing users to immediately understand the progress without opening the document. These enhancements improve usability and transparency, enabling users to navigate large disclosure documents more efficiently while gaining better control over the workflow process.

Word add-in - Filter Document Parts by Status and Assigned Actions

Intelligent Disclosure now provides filtering capabilities within the Outline, enabling users to quickly focus on the document parts that require attention. When opening the Outline—whether from an open or closed document—a dedicated filter icon is available. Users can filter document parts by workflow status or select the new “Assigned to me” option to identify activities that are currently waiting for their action. When the “Assigned to me” filter is applied, the system displays a flat list of only the document parts where the current user has a pending workflow action. Filters can

also be combined to further narrow the results. This enhancement helps users focus on their responsibilities and prioritize pending activities more efficiently within large disclosure projects.

Word Add-in Validations - Table Totals

Intelligent Disclosure extends Validation Rules with a new capability dedicated to the automatic verification of totals and subtotals in table objects. Users can now define validation rules specifically for totals without the need to tag each individual cell, simplifying rule configuration. With this enhancement, the system can automatically check that totals and subtotals are consistent even when manual edits are applied directly to the document or when rows are hidden in the source. This ensures that any discrepancy is immediately detected, preserving the integrity of disclosure documents.

Word Add-in Roll Forward – User Rights and Workflow Configuration

Intelligent Disclosure enhances the roll forward capability in the Word add-in by extending it to user rights and workflow configuration. When users roll forward a document, the system now automatically copies the workflow setup and the user rights configuration from the source document. The workflow structure – including approval levels and assigned roles – is preserved during the roll forward, while all workflow statuses are reset to allow a new review cycle to start. At the same time, user rights defined on the document are replicated, ensuring that access and responsibilities remain consistent across periods. This enhancement eliminates the need to manually reconfigure workflow and permissions after each roll forward, improving efficiency and reducing the risk of inconsistencies.

Word Add-in Import configuration

Users now have the ability to export and import add-in configurations, which simplifies the distribution and standardization of settings across users. Administrators can now generate a configuration file and share it with end users, who can easily import it to automatically apply the predefined setup. This feature enables a consistent configuration experience across teams, ensuring that users work with the same predefined settings without requiring manual setup.

Word Add-in Superscript Conversion for Footnotes

When defining footnote references using the “#N#” syntax (e.g., “#1#”), the system now automatically converts them into superscript format during disclosure document rendering. This capability supports defining the “#N#” markers directly in the data model, such as within account descriptions. By managing footnote references at the data level, users can centralize and standardize footnote handling across documents, ensuring consistency without requiring manual formatting in each disclosure.

Word Add-in Workflow Actions Report

Users can now download an Excel report that provides the complete history of workflow actions performed on each document, enhancing visibility and traceability across the document lifecycle. The report includes key details such as document path, user, timestamp, version number, and related comments (when available), giving administrators and contributors a comprehensive audit trail of all workflow activities. This capability strengthens governance and accountability, while supporting compliance requirements and simplifying review processes.

Functional Platform: Repository and Utilities

Audit Log Enhancements

Service Pack 37 offers several enhancements made to the Metadata log report to improve data traceability, usability, and analysis efficiency, which include:

- displaying only records with actual value changes to reduce noise and focus on relevant updates;
- advanced filtering options (field description and change origin);

- improved visibility with additional columns, including the field key descriptions; and
- strengthened traceability through consistent logical key visibility instead of physical key visibility.

Key benefits include:

- faster identification of relevant changes;
- improved auditability and compliance support; and
- more efficient analysis through enhanced filtering and readability.

Intelligent Analytics

Excel Add-in

Filter Panel Search

Users can now search hierarchy elements in the filter panel: after inserting the code or part of the description, the list of matching elements is returned.

Additional Drill Down Options

All Drill options are now available also for “TGK.DISPLAY” formulas: “Children”, “Descendants” and “Lowest Level” elements.

Subtotals in Pivot Tables

Pivot tables now support subtotals and expand collapse actions.

“TGK.DISPLAY” Formula Display Options

Users can choose what to display as text in “TGK.DISPLAY” formulas, by using either a predefined code, description or code and description options, or setting a custom string.

Objective AI

New Version of Deep Learning for Anomaly, Forecast, Analysis* 6.0.1

With this major release of Deep Learning for Anomaly, Forecast, Analysis, new parameters are now available as follows:

- “MAX_TRAINING_DURATION_SECONDS”: this parameter enables users to define the maximum allowed duration for model training, default value is 6h and can be updated.
- “MIN_LAG”: this enables users to specify the minimum lag value used during feature generation (default “1”).
- “INCREMENTAL_TRAIN”: to enable incremental training mode. When set to “Y”:
  - Full model retraining is skipped.
  - The model is updated incrementally using new data.

  Note: The input dataset for incremental training must contain the complete historical dataset, including all records used in previous training runs.

The following new columns in input/output datasets for the train/execute process are now available:

- “ROW_FLAG” (Execute Phase) for Multiple Scenario Simulation: the new column has been added to all execution datasets to support advanced execution scenarios:

  - Set the value to “IGNORE” to exclude specific rows from execution.
  - Assign custom string labels (other than “IGNORE”) to group rows and run multiple simulation scenarios in parallel.

- “SEASONALITY” (Training and Execution Outputs) to feature importance and feature contribution outputs: for rows associated with seasonal features (generated through existing seasonality parameters), this column reports the corresponding seasonality value of the target variable.

Finally, the “SCALE_FEATURES” parameter has been renamed “SCALE_TARGETS”. As part of this change, feature scaling is now always applied internally by the model, and the parameter now controls whether standard scaling is applied to the target variable. The default value is “N”; however, enabling target scaling may improve model performance in specific use cases.

Since this is a major release, upgrading from an older version of the model will require the addition of the new columns to the datasets, as well as the reconfiguration of the mappings for the training and execution tasks.

* Deep Learning for Anomaly, Forecast, Analysis is a proprietary multi-target neural model based on Deep Learning technology, designed to support high execution performance and scalability. This model enables the following functional use cases:

- Anomaly Detection (cross-process)
- Driver-based Analysis (cross-process)
- Predictive Planning and Forecasting (process-specific to Budgeting & Planning)

Extended Business Planning

Supply Chain Planning

Checkmark Column

Users can now use the “Checkmark” column to flag grid rows as reviewed. This property can be used for sorting rows within the grid.

SOLUTIONS WITH PREDEFINED CONFIGURATIONS
Some Basic Info

The features listed below are scheduled to be released starting from August 10, 2026. They are compatible with CCH Tagetik Service Pack 37. As soon as they become available, the installation packages will be uploaded to CCH Tagetik Community website.

Account Reconciliation

The below features are part of the “R.24” release, scheduled to be available starting from August 15, 2026.

Account Reconciliation Dashboard

The new Account Reconciliation Dashboard provides users with a comprehensive overview of reconciliation activities. The dashboard features a histogram-based landing page that displays reconciliation breakdowns by status, including “Rejected”, “Overdue”, “Imminent”, “To Reconcile”, and “Reconciled”. Within each status category, a stacked visualization highlights risk levels (Low, Medium, and High) allows users to assess the overall risk profile efficiently. A top KPI summary panel presents key metrics such as “Unbalanced”, “Rejected”, “Overdue”, “Imminent”, “To Reconcile”, “Reconciled”, and risk distribution. For more granular insights, the dashboard offers an Entity-level detail view with a card-based layout and supports seamless switching between chart (histogram) and Entity breakdown modes. All dashboard components update dynamically as filters are applied, enabling logical drill-down by Entity and providing aggregated insights for improved usability.

Comments Integration within Account Reconciliation Cockpit

The new Account Reconciliation Cockpit, built on an updated UI/UX, now allows users to create comments for each reconciliation object directly within the interface. This enhanced cockpit supports file attachments and user mentions in comment threads, making collaboration easier and more effective. Users can assign comment threads to specific individuals, ensuring responsibility and follow-through, and can resolve threads once discussions are completed, streamlining communication and improving the overall reconciliation workflow.

Editable Grid View

A new Grid View has been introduced to simplify reconciliation. The grid interface allows users to easily manage reconciled and explained items, switching seamlessly between Grid View and Webform View. Features such as multi-edit, row cloning, and advanced filters enhance productivity and improve item searching. Spreadsheet-like functions enable bulk addition, modification, or deletion of items.

Custom Reconciliation Frequency Definition

The system now allows users to expand the available reconciliation frequency options by creating and managing custom frequencies. This means that users can tailor their reconciliation schedules to fit their unique policy needs, specifying exactly when reconciliation should occur. Users can add their own frequency types and choose the months when each reconciliation process is required.

Templates Assignment Rules Enhancements

Users now have increased flexibility in determining which template must be utilized for the reconciliation process. The system has been enhanced with the possibility to specify template assignment at the level of each individual Reconciliation Object. This means that, rather than being restricted to using broad assignment criteria by account or account classification, administrators and users can now tailor the reconciliation process by selecting the most appropriate template for each specific Reconciliation Object, ensuring a more precise fit with their organizational needs.

Additionally, the functionality includes the option to designate certain templates to be used exclusively for Group reconciliation objects. By flagging a particular template, users can ensure that it will be automatically assigned only to those objects that are part of a group reconciliation, further streamlining the process and reducing the risk of errors or misassignments. This dual approach to template assignment contributes to a more customizable, efficient, and accurate reconciliation workflow.

Operational Transfer Pricing

The below features are part of the "R.04" release, scheduled to be available starting from August 15, 2026.

Additional Margin Calculation and Monitoring Level (Entity – TP Function Level)

The system now introduces a new higher-level calculation layer that extends the existing Transfer Pricing logic, enabling users to perform initial analysis at Company and Transfer Pricing (TP) Function level before drilling down to Trading Partner details. This enhancement provides a more structured and intuitive way to explore TP results. Users can first review aggregated outcomes at a broader level, gaining an immediate and synthetic view of the performance across entities and functions. From there, they can progressively drill down into Trading Partner data, benefiting from a more guided and efficient navigation path. By shifting from a purely detailed-level analysis to a hierarchical approach, the feature improves both usability and analytical clarity. It reduces complexity in the initial review phase, enhances result readability, and introduces an additional summarized perspective that was not previously available.

Possibility to Manually Segment "Unassigned" Transactions

The solution now lets users drill down into unassigned "delta" transactions to review records not segmented by rules or the allocation engine. Users can also manually assign a TP Function to these transactions as needed, handling exceptions or cases that cannot be managed automatically.

Enhancements to Segmentation Engine

The configuration of Segmentation Rules has been improved to offer additional capabilities. Users can now designate segmentation rules as either Active or Inactive, which provides greater flexibility, especially during the initial implementation phase of segmentation rules or when introducing a new, specific rule. This enhancement makes it possible to deactivate concurrent rules and observe how the new configuration affects results.
Additionally, this functionality can be valuable for temporarily disabling rules that are not currently relevant but that users do not wish to permanently remove. Finally, users can assign a descriptive label to each segmentation rule using a customizable textual field. This explanatory information will be included with each transaction that is segmented by a particular rule, thereby facilitating easier auditing and analysis of the rationale behind why transactions are allocated to certain segments.

Dynamic Benchmark Adjustments Management

The solution now offers a highly flexible configuration that allows users to dynamically adjust benchmark values, ensuring that these benchmarks accurately reflect the unique conditions associated with each business and customer. Users have the capability to introduce an unlimited number of adjustment elements within a dedicated analytical dimension, making it possible to tailor adjustments to a wide range of scenarios. These adjustment elements can be utilized to set percentage-based modifications for every configured TP Method, TP Function, or Entity, providing granular control over how benchmarks are managed across the organization.
Typical examples of such adjustments include FX risk adjustments, logistics-related costs, and other business-specific factors that may influence transfer pricing outcomes. This expanded flexibility empowers users to respond promptly to changing market conditions or operational requirements, enhancing both the precision and relevance of transfer pricing analyses.

Benchmark Definition at Entity Level

The Benchmark Definition has been improved by introducing a new level within the TP Method and Benchmark configuration framework. In addition to the existing benchmark hierarchy level (general, region and country level), users can now define benchmark values directly at the Entity - TP Function level, providing a dedicated override mechanism for specific legal Entities before the final benchmark values are deployed into the deployed benchmark table and applied for monitoring. This enhancement increases the flexibility and granularity of benchmark management, enabling users to address Entity-specific transfer pricing requirements that cannot be fully managed through global, regional, or country-level definitions. This results in greater accuracy, transparency, and adaptability in benchmark management for complex multinational structures.

Calculation Details Report

The new Calculation Details Report provides users with a comprehensive platform for in-depth analysis of their transfer pricing results. With this report, users can systematically review each step of the calculation process, starting with the identification of the specific Transfer Pricing (TP) Method applied to each transaction or segment. The report presents a breakdown of all relevant formulas, detailing each component, such as input data sources, calculation steps, and parameter values, used in determining the outcome. Additionally, it displays the resulting calculated values alongside supporting data, enabling users to easily trace how each figure was derived. This level of transparency facilitates effective reconciliation by allowing users to compare system-generated results with external benchmarks or expected outcomes and supports robust validation processes by documenting the entire calculation methodology. As a result, users may audit, justify, and refine their transfer pricing positions with greater clarity.

Price Setting (Use Case)

The new functionality introduces a comprehensive framework for defining and managing price settings within Operational Transfer Pricing processes. It enables users to ingest cost components at material code level, associate each material with a specific cost pooling logic based on predefined but still configurable costing methods, and apply flexible markup rules driven by business dimensions such as destination market, product class, and supplying Entity. Through this configuration, the system can automatically derive consistent and auditable intercompany price lists. By combining granular cost inputs with configurable markups, the feature supports advanced transfer pricing strategies while ensuring alignment with organizational policies and operational efficiency.

Global Minimum Tax

The below features are part of the “R14” release, scheduled to be available starting from August 10, 2026.

GIR Compliance Enhancements and Correction Filing Improvements

Release 14 includes all GIR compliance-related bug fixes identified over the last weeks across both GIR Reporting and GIR Filing processes, covering the issues reported since R12.4. Detailed product Release Notes will be published separately. In addition to the planned fixes, the correction filing process has been improved through the automatic proposal of the retrieval and population of the technical references required for corrective submissions. By reusing relevant identifiers from previously accepted filings, the solution reduces manual effort, minimizes errors, and improves the consistency and efficiency of the correction process. Finally, this release introduces a new submission history framework that ensures all filed XMLs are retained and available for future reference, providing a complete audit trail while preserving the latest version of the information submitted to tax authorities.

Tax Provision and Reporting

The below features are part of the “R10” release, scheduled to be available starting from August 10, 2026.

Deferred Tax Scope Management

A new flag at the group level has been introduced to classify Balance sheet accounts as in scope or out of scope for Deferred Tax calculations. Equity accounts and tax-related accounts (e.g., tax receivables, tax liabilities, and deferred tax accounts) can now be excluded from temporary difference calculations.

Equity and OCI Balance Tracking Enhancement

Equity and OCI reporting have been enhanced to provide greater visibility of balances over time. The solution now supports reporting of opening and closing balances for Equity and OCI, enabling users to track the full equity position, not only the current year movements.

Lease Accounting (IFRS16)

The below features are part of the “R2.37” (java version) release, scheduled to be available starting from August 14, 2026.

Deferred Tax Rate Table and Deferred Tax Rate Adjustment

Deferred tax rates can now be configured through a dedicated Tax Rate Table available in configuration report “V21_041”. Tax rates can be defined by Process, Year, Entity, Asset Class, and Period, enabling a more granular setup than the generic tax rate maintained in the Deferred Tax worksheet. When the Tax Rate Table is populated, the configured tax rate overrides the generic Deferred Tax rate. If no specific tax rate is available in the table, the system automatically falls back to the generic tax rate defined in the Deferred Tax configuration. In addition, when the deferred tax rate changes from one period to another, the system automatically calculates a Deferred Tax Adjustment and stores the impact in the “DEFERRED_TAX_ADJ” measure. This adjustment reflects the effect of the tax rate change on deferred tax calculations and ensures that the Deferred Tax Balance Sheet account is fully reversed, resulting in a zero balance at the end of the contract.

Contract Creation Date Added to “V21_033” Modification Report

A new Creation Date field has been added to the “V21_033” Modification report to display the original contract creation date. The field is automatically populated when a new lease contract is created through “V21_033_CREATE – Contract Creation” and is protected from manual changes. This enhancement enables users to easily identify and validate all contracts created during the month-end closing process by filtering the report on the contract creation date. This feature improves the auditability and monitoring of newly created lease contracts, providing greater visibility and control over contract additions.

Configurable “ASSET_VAR” Handling for Transfer Events

A new configuration flag has been introduced to control the treatment of the “ASSET_VAR” measure during transfer events. The flag allows administrators to define whether the “ASSET_VAR” measure should be included or excluded in transfer-related calculations. This enhancement provides greater flexibility in adapting transfer accounting behavior to specific business and reporting requirements without requiring system customizations.

ESG & Sustainability Performance Management

The below features are part of the “Summer 26” release, scheduled to be available starting from August 10, 2026.

Introduction of Scenario/Period-Based Consolidation Configuration

The solution has been enriched with the possibility to define Scenario/Period consolidation rules in a dedicated partitioned dataset (i.e., “[000263] Consolidation Mapping Rules - Partitioned Rule”), complementing the existing configuration; this additional setting allows a more dynamic and timing consistent management of consolidation rules.

Omnibus: Integration of Dedicated Control Groups

Dedicated control groups have been added to the solution allowing quality checks on balances reported, applied to new CRSD Omnibus Directive.

Omnibus: Output Disclosure Review

In this release, to comply with Omnibus framework regulation, the solution provides a dedicated folder (i.e., “KPI_OUT_OMNB”) which contains several OMNB Output reports suggested; these reports are not mandatory but recommended by the Regulation.

Data Entry Change Log

This release introduces a new feature to historicize changes made to any of the editable fields on data Entry reports. Changes reported in this new log collector (“[000262] Data Log Trail”), where users can see the specific time at which each modification has occurred come from any direct modifications applied to Data Entry forms or via Load procedures.

Ready-to-use Standard Omnibus

Starting with the Summer 2026 release, the ESG Solution introduces a new Ready-to-Use Post-Omnibus CSRD reporting option designed to accelerate compliance with the evolving CSRD regulatory framework. This option delivers a fully standardized set of Post-Omnibus CSRD KPIs and reporting structures out of the box, enabling organizations to achieve compliance with minimal implementation effort and limited configuration requirements. Key features of the proposed framework are:

- Predefined Post-Omnibus CSRD KPI accounts delivered out-of-the-box and aligned with standard regulatory requirements;
- Fully standardized content model without any possible customization; and
- Ready-to-use multidimensional reporting structures designed to support mandatory disclosure needs without additional configuration.

GRI Updates: 102 – Climate Change 2025; 103 – Energy 2025

The GRI reporting framework content has been updated to reflect the latest regulatory developments and requirements, ensuring full alignment with current disclosure standards and reporting obligations.

EU Taxonomy

The following additions are now available.

EU Taxonomy for Insurance and Reinsurance Undertakings:

- Management voluntary eligibility on the investment side – step 2
- Management of nuclear and fossil exposure percentages – step 2
- Management of investment positions – Article 7
- Management of “policy effective date” for underwriting
- New data model input for external data (focus on issuer code KPIs)

- Management of new issuer code KPIs in DTP calculation logic

EU Taxonomy for Asset Managers:

- Management of voluntary eligibility for the Annex IV template of the Omnibus Directive

EU Taxonomy for Credit Institutions:

- Management of AIH input export to the new sector information template with a dynamic matrix
- Update of NACE codes on the Custom Dimension 4

ESG Planning & Analytics Accelerator

Predictive Forecasting – Use Case*

A detailed use case has been included to demonstrate how the Predictive Forecasting feature model can be leveraged to predict emissions trajectories and how these predictions can subsequently be integrated into the Business-as-Usual (BAU) process. The objective of this use case is to provide a complete end-to-end simulation of the predictive forecasting process, having a quantitative example comprehensive of expected outcomes at each stage. The scenario covers the entire workflow of this phase, starting from historical data ingestion, progressing through model training and calibration. The process also includes prediction validation and the final application of the forecasted results within the Business-as-Usual phase, illustrating how predictive insights support more informed planning and decision-making.
*Note: Predictive Intelligence functionalities are available for “on cloud” deployments only.

Scaling Factor Application – Conservative Approach

In the application of deterministic calculation forecast to Business-as-Usual (BAU) phase, the emissions growth rate can be applied using a more conservative approach by adopting the group-level growth rate whenever it is higher than the rate calculated for an individual Entity. This methodology enables the prediction model to account for the overall growth dynamics of the group while avoiding overly optimistic assumptions at the Entity level. As a result, the forecast can better reflect a scenario in which each company is expected to implement an increasing number of sustainability initiatives aimed at further reducing emissions over time.

Such an approach provides a prudent baseline against which the effectiveness of future decarbonization actions and reduction strategies can be assessed.

ESG Carbon Emissions

Driver for Configurable Data Entry Forms

A new functionality allows users to select which data fields are displayed in each Scope-category Data Entry form. The selected field configurations are applied across Collection forms, Emission Factor Mapping forms, and Calculation forms, enabling a more tailored data entry experience.

New Pre-configured Emission Factors Library

A newly introduced Emission factors Library regularly issues by EDGAR – The Emissions Database for Global Atmospheric Research – provides users with global country-level emission factors for years 2020 to 2024. The emission factors are expressed in tons of CO2-eq per US Dollar. The Database is applicable to the Sovereign debt asset class.

Solvency II Solution

EIOPA – Solvency II Solution

This solution has yet to be released on Service Pack 37. Users should note that the recommended minimum release is 5.3.36, as this version has been tested for this specific solution. The Solvency II Solution version "Fall26" scheduled to be released on October 2, 2026 will be compatible with CCH Tagetik version 5.3.37.

Bank of England - PRA Solvency II Solution

This solution has yet to be released on Service Pack 37. Users should note that the recommended minimum release is 5.3.36, as this version has been tested for this specific solution. The Bank of England – PRA Solvency II Solution version "Fall26" scheduled to be released on 2nd October will be compatible with CCH Tagetik version 5.3.37.

New Module: IRRD – EIOPA Insurance Recovery and Resolution Directive Solution

The below features are part of the "Fall2026" release, scheduled to be available starting from October 2, 2026.

The CCH Tagetik IRRD Solution provides insurance and reinsurance undertakings with a fully predefined configuration to comply with the EIOPA Implementing Technical Standards (ITS) on Resolution Reporting, issued under the Insurance Recovery and Resolution Directive (Directive (EU) 2025/1). The features of the "Fall26" release include:

- New omni-comprehensive IRRD Documentation; and
- Integration of the official Data Model Point as released by EIOPA stands for European Insurance and Occupational Pensions Authority on 27 July 2026, excluding the business and technical validations which will be part of next "Winter26" release.

IFRS17 Solution - Insurance Contracts

The below features are part of the "SUMMER2026" release, scheduled to be available starting from August 14, 2026.

Bug Fixing

This release includes bug fixing.

iXBRL software (powered by CoreFiling)

The below features are part of the 1.98.2 iXBRL Solution version (or higher) release, scheduled to be available starting from June 25, 2026.

New Features

ESMA ESEF Taxonomy 2025
Support for the ESMA ESEF Taxonomy 2025 has been added, including both the **IAS 1** and **IFRS 18** entry points to support the transition to the new financial statement presentation requirements. This enhancement enables users to prepare and validate reports in accordance with the latest ESMA regulatory requirements.

Read-only calculations in the sidebar
Read-only calculation relationships for the selected concept have been added to the side bar. This enhancement allows users to quickly view the calculation hierarchy associated with a concept without leaving the current context, improving visibility and making the review process more efficient.

Enhanced calculation tree information
Additional information has been added to the Calculation Tree, including credit/debit attributes and associated tags. This enhancement improves transparency of calculation relationships and makes it easier to review and validate tagged data.

Default context fallback
A fallback mechanism has been introduced to automatically use the filing's default context whenever no context can be identified from the table. This enhancement improves reliability during tagging and helps ensure that a valid context is always applied.

EBA – Consolidated FinRep

This solution has yet to be released on Service Pack 37. Users should note that the recommended minimum release is 5.3.36, as this version has been tested for this specific solution. The EBA – Consolidated FinRep Solution version “Fall26” scheduled to be released on 27th November 2026 will be compatible with CCH Tagetik version 5.3.37.
