

Business case: Solutions

Wolters Kluwer

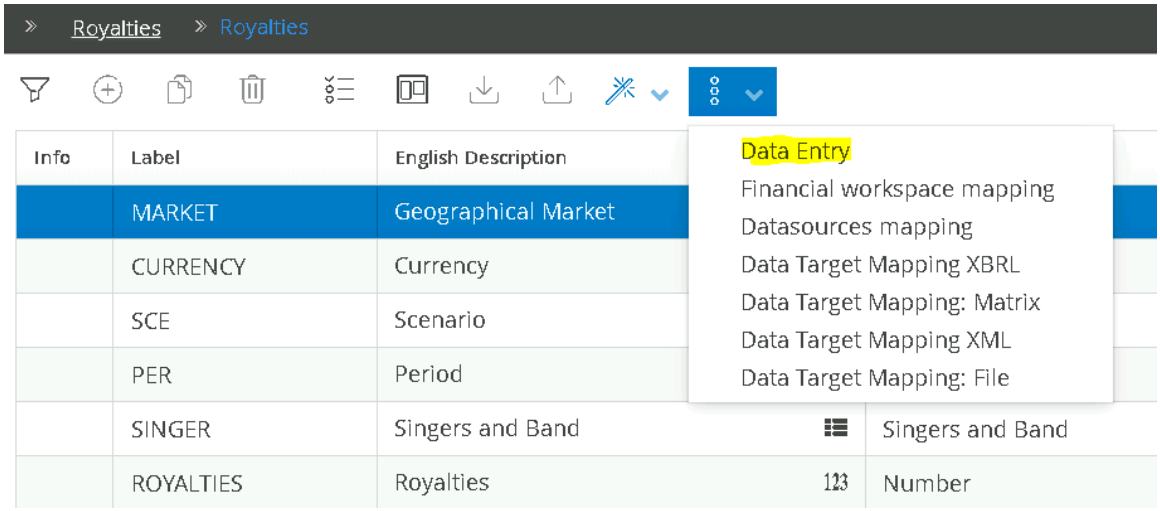

CCH® Tagetik | ACADEMY

Business case solutions:

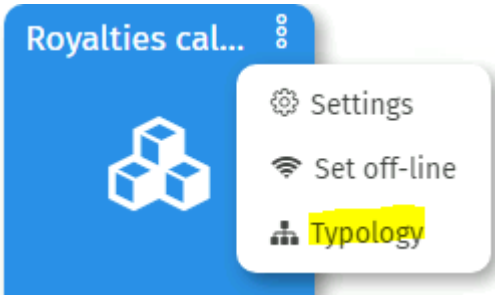

1. Create the **Analytical dimension** *Singers and Band* (Default element code: GEN_S description Generic Singer). Use the export/import feature and copy the values (columns A and B) from the file *Singers and band.xls*; then create a new hierarchy based on the content of the third column.
2. Create the **Custom Dimension (e.g. Custom Dimension 3)** *Geographical Market* (we need to upload these details in the Financial workspace; Default element code: GEN_M description Generic Market). Repeat the procedure reported in point 1.
3. Create a new Analytical Workspace with 3 datasets:
   - **Royalties** (open the xls file "Royalties" to add new fields in the dataset and copy the same column descriptions in the labels; remember to drag and drop the dimensional fields on the left such as the market, currency, scenario/period etc.)
   - **Listening Data** (open the xls file "Royalties" to add new fields in the dataset and copy the same column descriptions in the labels; remember to drag and drop the dimensional fields on the left such as the market, scenario/period etc)
   - **Royalties calculation (this is the dataset in which we will perform the calculation with the following fields:**

Info	Label	English Description		Field type
	SCENARIO	Scenario		Scenario
	PERIOD	Period		Period
	SINGER	Singers & Band		Singers & Band
	CURRENCY	Currency		Currency
	NUM_AUDIENCE	Audience number	123	Number
	MARKET	Geographical Market		Geographical Market
	ROYALTIES	Royalties	123	Number

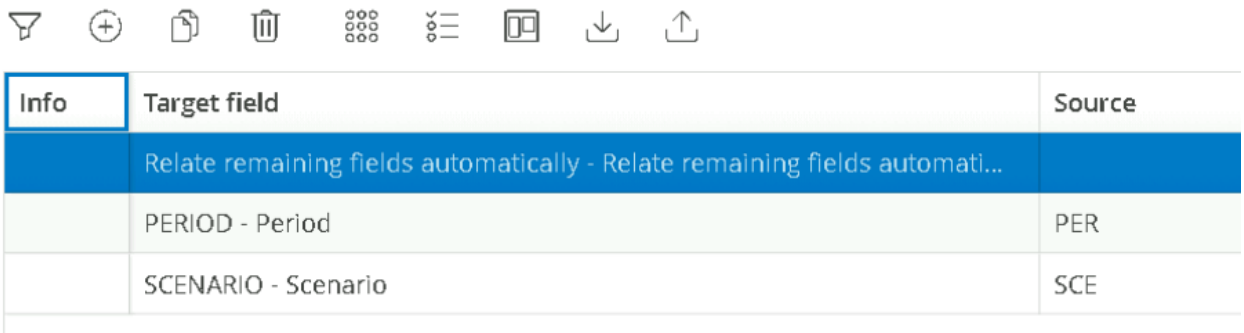

4. Set the Dataset online (when you receive a warning, click ok) and run a general deployment
5. Run the data entry (Process 2030ACT) inside the datasets Royalties and Listening data (if you receive an error , check that the AW is Online); after running the data entry, close the form

6. Access the process cockpit 2030ACT and run the task **Load data** to upload data via Quick data loader in the datasets Royalties and Listening data (upload the file provided)
7. Create a new typology on the dataset Royalties calculation

8. Access the Data transformation package and create a new DTP named 010 - royalties calculation
9. Create a new activity with target dataset Royalties calculation and the new typology created and tick the options “Empty dataset” and “Update reporting layer”
10. Create 3 operations:
    a. 010 - Insert from another dataset (Source - Royalties); in the matching fields add the following fields

    b. 020- Join from another dataset (Source - Listening data); in the matching fields add the following fields.

Consider that if you named the measure as NUM_PLAYS you need to add this field in the place of NUM_AUDIENCE

Target field	Source	Relationship type
MARKET - Geographical Mark...	MARKET	Condition
NUM_AUDIENCE - NUM_AUD...	NUM_AUDIENCE	Attribute
PERIOD - Period	PERIOD	Condition
SCENARIO - Scenario	SCENARIO	Condition
SINGER - Singers and Band	SINGER	Condition

c. 030 - Enrichment with formula; in the matching fields add the SQL Formula **ROYALTIES*NUM_AUDIENCE** (or NUM_PLAYS, depending on the field name) on the Target field *ROYALTIES.*

11. Access the Business workflow and add a new DTP task in the profit & Loss step with the parameters :
    a. Analytical Workspace = Royalties
    b. DTP = Royalties calculation
12. Access the process cockpit and run the DTP task created; now the data have been uploaded into the dataset royalties calculation
13. Access the Fx rate and add the new rows according to the file provided “Fx_rates”
14. Access the excel interface and expand the folder $AW , $005 – Royalties ; you can find the line by line forms just created (make sure that they are editable)
15. Run the forms in navigation and check that you have the same rows of the dataset partition
16. Below this folder 005- Royalties create a new multidimensional form **10 – Royalties calculation** retrieving data from Royalties calculation dataset
17. Add the following filters:
    a. Rows filter = GEN – Singers and band hierarchy node and set the dynamicity as Insert lowest level elements with Subtotal to “Yes” and Pruning “To zero”
    b. Column filter = Geographical market node and set the dynamicity as Insert lowest level elements with Pruning “To zero”
    c. Matrix filters

Set the conversion “Based on the measure” on the Currency

Set the Tagetik style (Simple Style)

19. Access the dataset Royalties calculation in the web interface and set the field “Royalties” the conversion type “Final FX Rate”

20. Add the new cell fields as reported in the file provided

21. Look at the structure of the form **20 – Profit & Loss** and create a new Financial Statement Template following the file provided

Code	English Description	Formatting	Item type	Class	Formula
010	Premium revenues	0	Parent Item	Revenue	
020	Adverting revenues	0	Parent Item	Revenue	
025	Total Revenues	0	Formula Standard	None	[040|010]+[040|020]
028		0	Description	None	
030	Royalties	0	Parent Item	Cost	
040	Advertising commisiom	0	Parent Item	Cost	
050	Other Cogs	0	Parent Item	Cost	
055	Total costs	0	Formula Standard	Cost	[040|030]+[040|040]+[040|050]
057		0	Description	None	
060	Gross margin	0	Formula Standard	None	[040|025]-[040|055]
065		0	Description	None	
070	Research and development	0	Parent Item	None	
080	Marketing	0	Parent Item	None	
090	General and administrative	0	Parent Item	None	
100	Personnel	0	Parent Item	None	
110	Operating income	0	Formula Standard	None	[040|060]+[040|070]+[040|080]+[040|090]+[040|100]
120	Operating margin %	0	Formula Standard	None	[040|110]/[040|010]

22. In the FST relationship add the following rows:

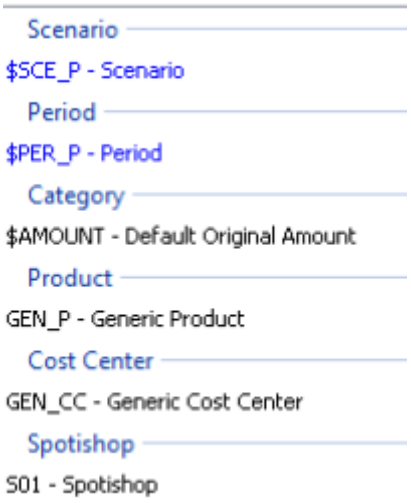

Action	Account	FST item
Include	BC010 - Premium revenues	010 - Premium revenues
Include	BC020 - Advertising revenues	020 - Adverting revenues
Include	BC030 - Royalties	030 - Royalties
Include	BC040 - Advertising commision	040 - Advertising commisiom
Include	BC050 - Other Cogs	050 - Other Cogs
Include	BC060 - Research and development	070 - Research and development
Include	BC070 - Marketing	080 - Marketing
Include	BC080 - General and administrative	090 - General and administrative
Include	BC090 - Personnel	100 - Personnel

Run the deploy

23. Create a new folder named Business case – Profit & Loss

24.Create a new data entry form **Profit & Loss** and add the following filters:

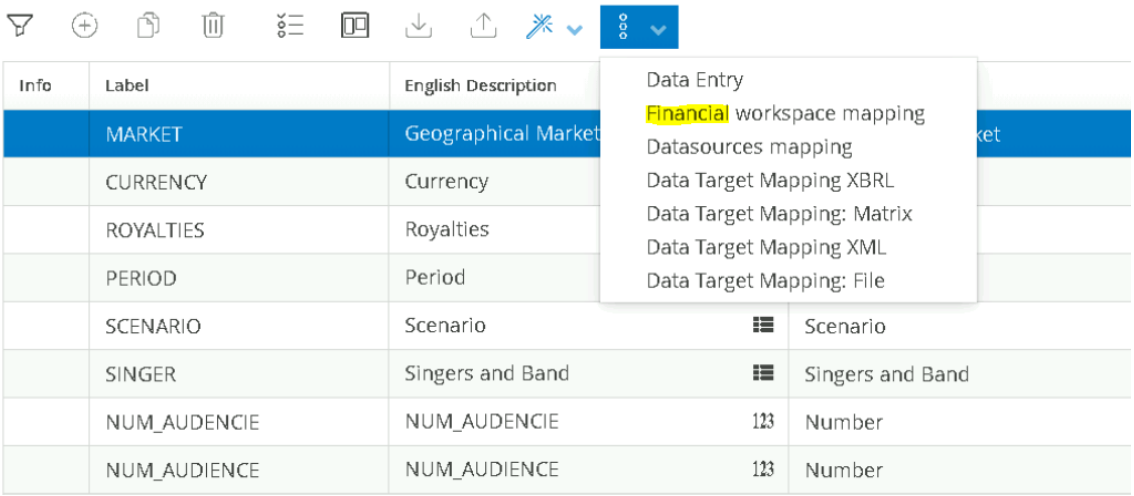

a. Row filters = add the new fst created 
b. Column filters = Geographical market hierarchy node and set the dynamicity as Insert lowest level elements with Pruning “To zero”
c. Matrix filters:

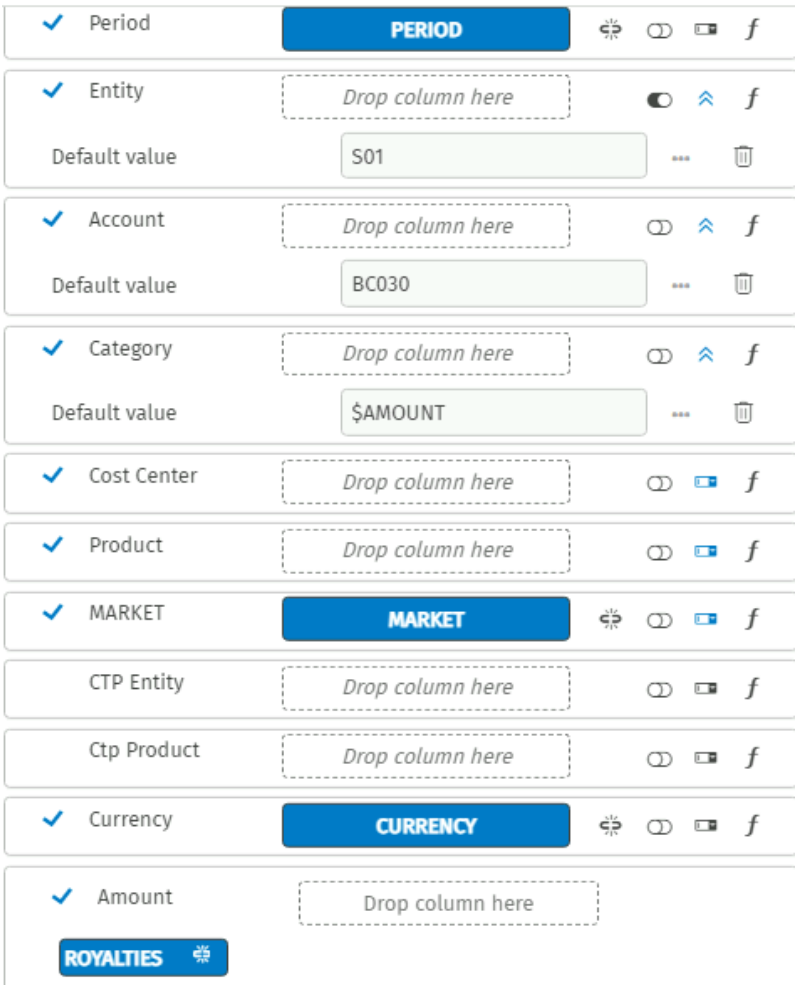

Set the Tagetik style (Simple Style)

25. Remember to set the editability on the rows and deploy the process to make the form as editable; set the row Royalties as protected.

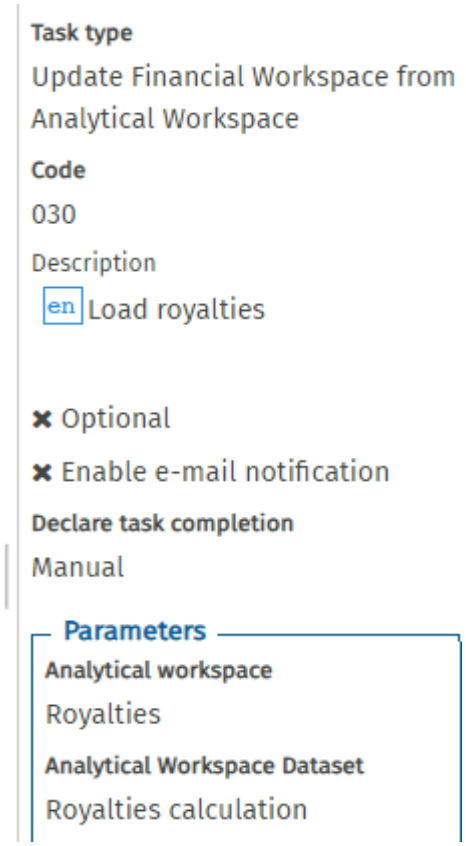

26. Access the dataset Royalties calculation and click “Financial workspace mapping”

27. Perform the mapping and add the “Royalties” as Amount field; take a look at the default value field (remove the default value GEN_M on the Market):

28. Access the workflow and add an “Update Financial workspace from AW” task

29. Access the process cockpit and run the Financial workspace mapping just created

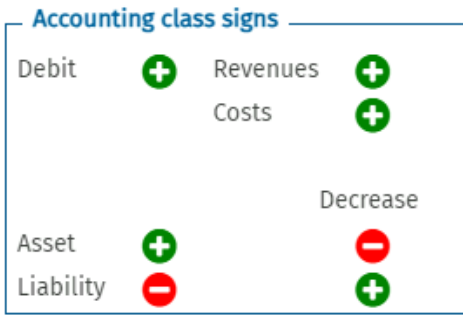

30. Upload the file “Original gross amount” by qdl from the process cockpit to upload data in the form; Please note that during the mapping of the QDL you need to:

- Remove the relationship between Market and default value GEN_M and drag and drop the column with values.
- Set the deletion policy as “No Deletion”

You should have this result:

Description	Information	Result
Records extracted	Rows processed: 56	○
Records inserted in Gross amounts	Rows processed: 56 - Rows excluded due to warnings: 0	○

31. Change the Accounting class sign on the Revenues and run the form

Consider that you need to change the sign in the matrix on the formula fields.
