Content

1. Introduction 5
2. AI Automapping 5
3. AI Pipeline 10
4. AI Anomaly Detection **Errore. Il segnalibro non è definito.**
5. AI Driver-Based Analysis & Predictive Planning **Errore. Il segnalibro non è definito.**

1. Introduction

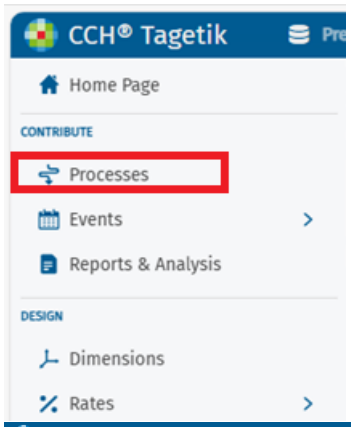

This User Guide describes how to use the Machine Learning environment so you can use it to practice. This Guide assumes you have:

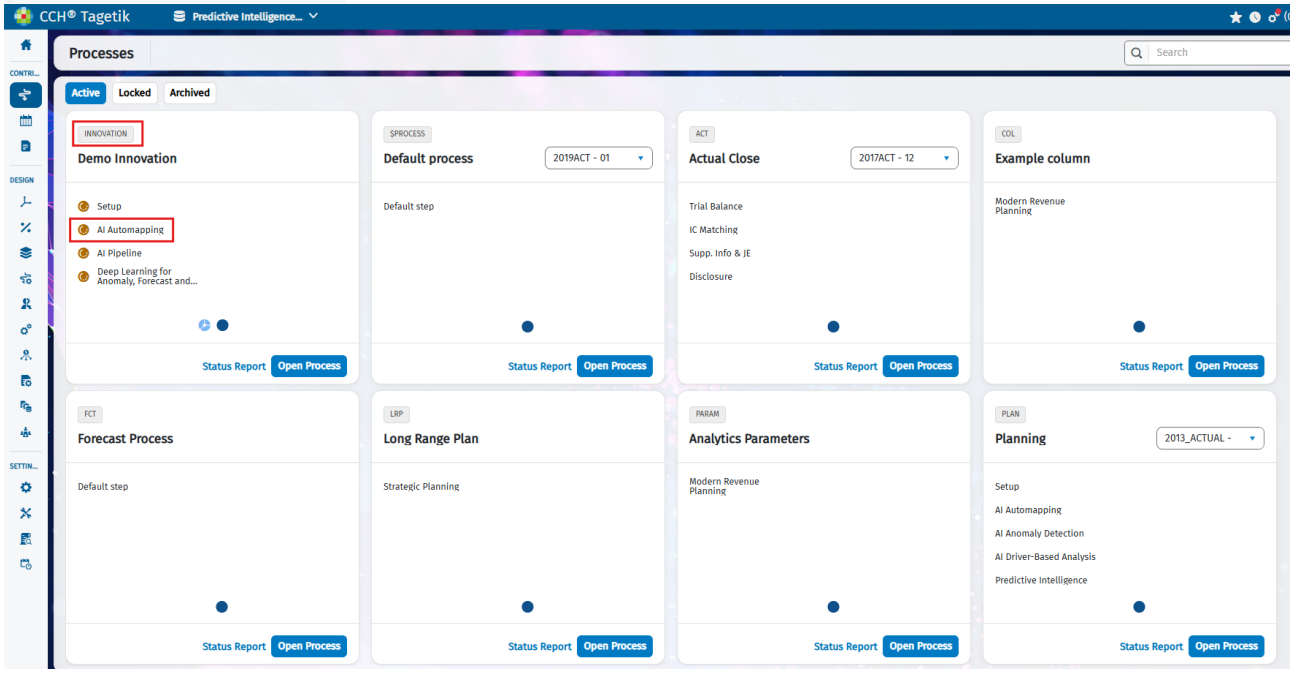

- logged into the Demo hub with your credentials
- created your own machine with the **One Template**
- imported the Demo environment and Machine Learning Model library

⚠ **WARNING:** For Demo purposes, no ML processes (Train and/or Execute) need to be executed.

2. AI Automapping

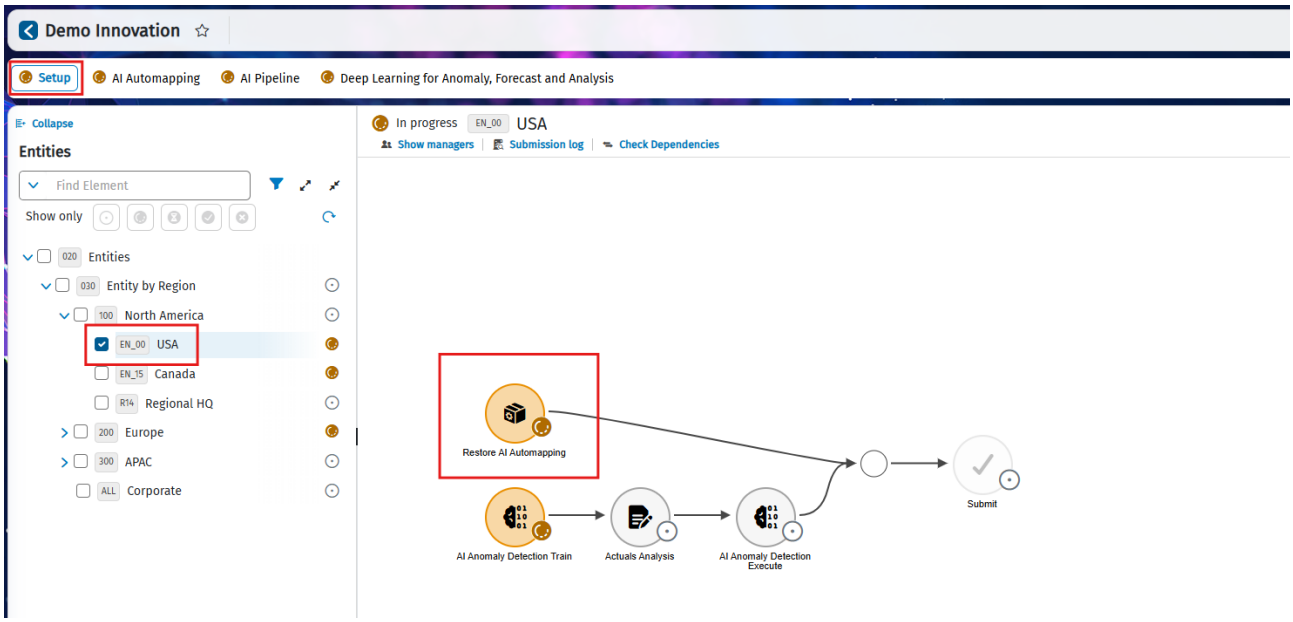

1. From the Setup & Admin Processes section, click the **INNOVATION – Demo Innovation** and click on Setup.

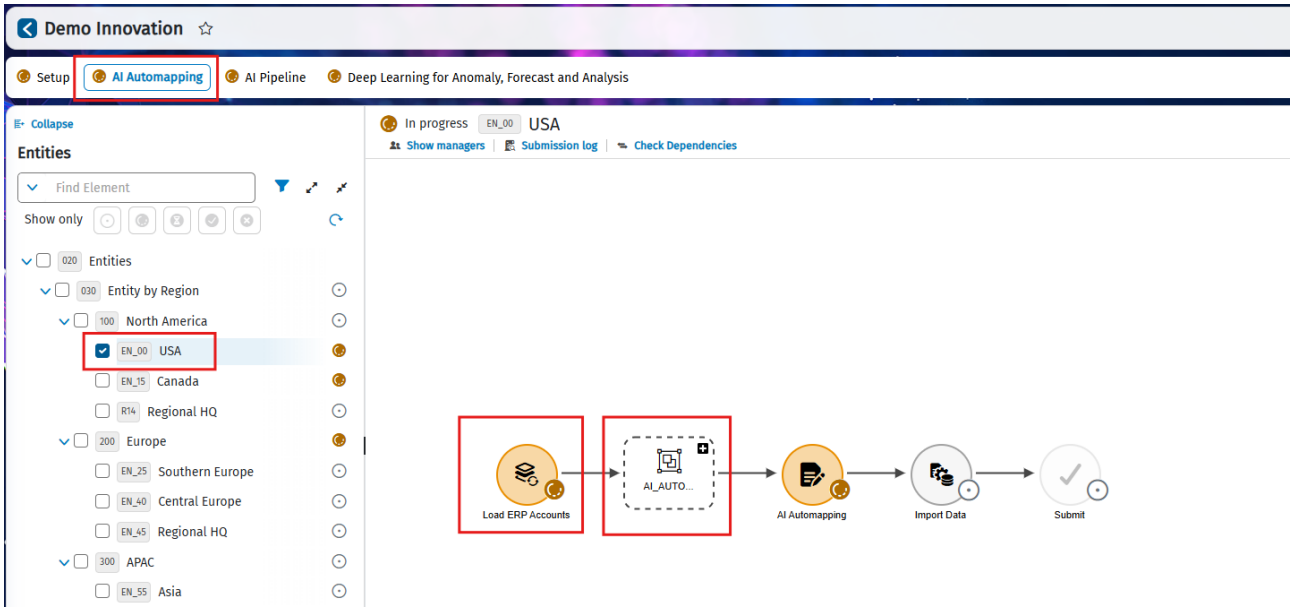

2. Set up the environment before starting the demonstration.

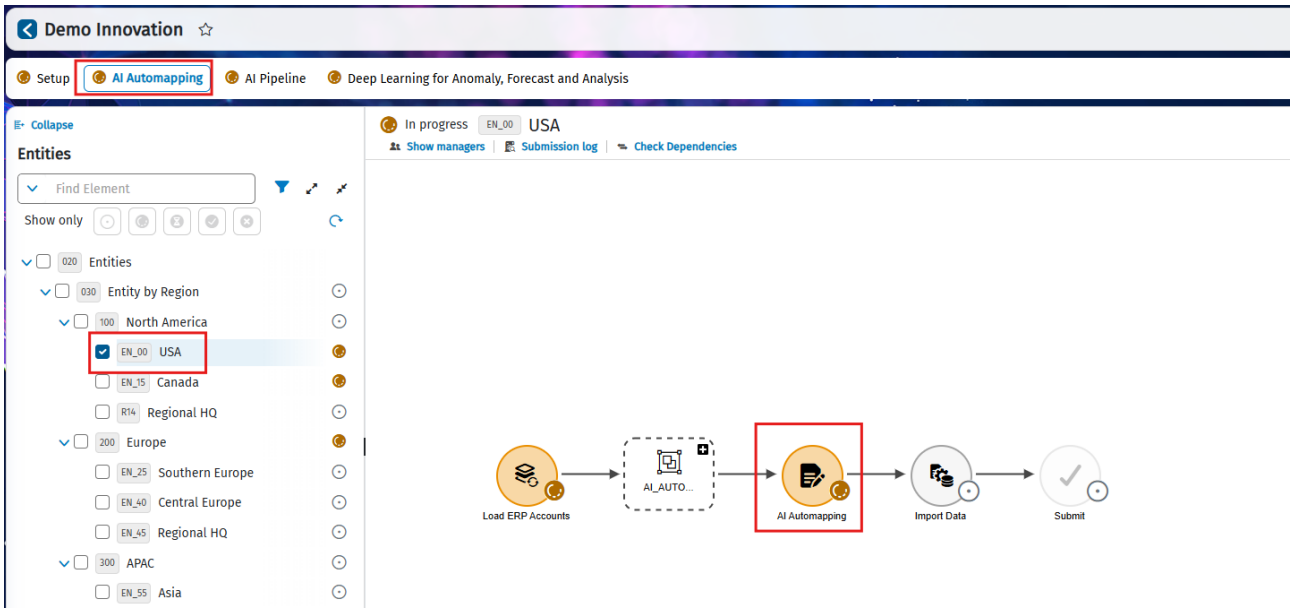

3. Go into **Setup** step, select the **EN_00 – USA** Entity and run the **Restore AI Automapping** task.

4. Click **AI Automapping** and select the **EN_00 – USA** Entity. We have already run the **Load ERP Accounts** task to upload external accounts and the AI_Automapping group to perform the mapping between external accounts and CCH Tagetik accounts.

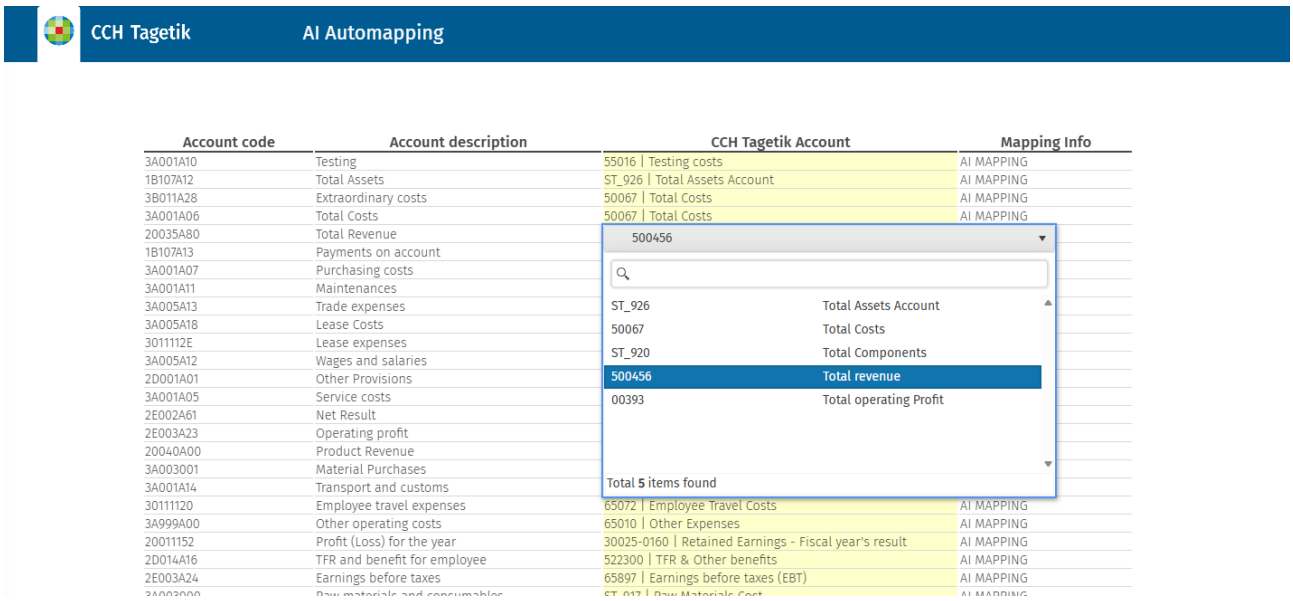

5. Click **Check Results** and select **Open Web**.

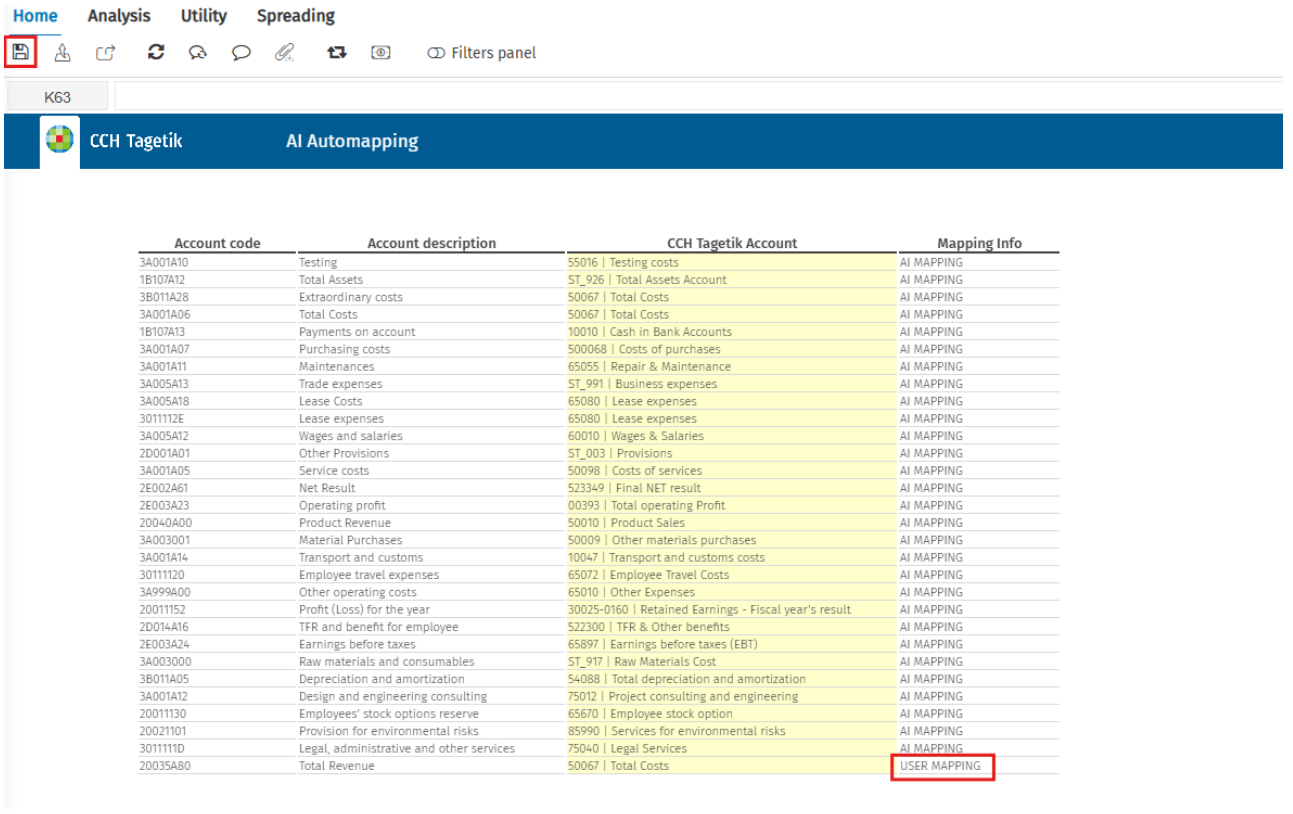

6. The report displays the first five accounts proposed by the software, sorted by plausibility, and the information related to the Mapping: if the mapping has been done by the AI you will see “AI MAPPING”, if the user has been changed some mapping, you will see “USER MAPPING”.

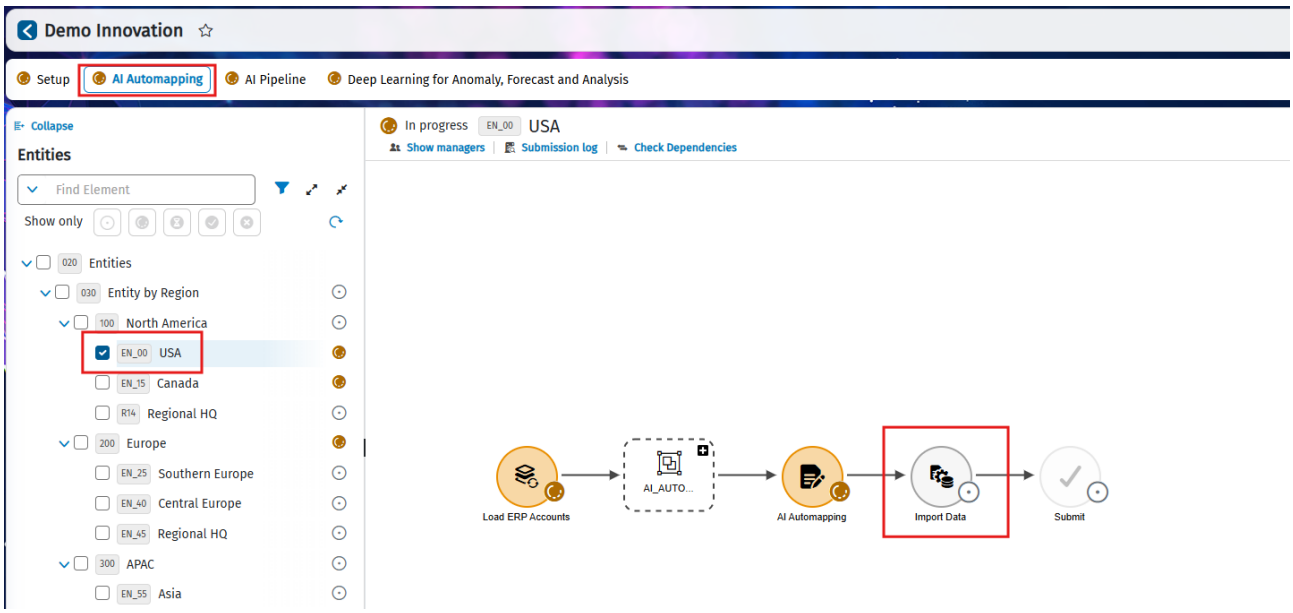

7. Change the **Total Revenue** cell to **Total Costs** by clicking the cell on the Total Revenue row in the Match column.

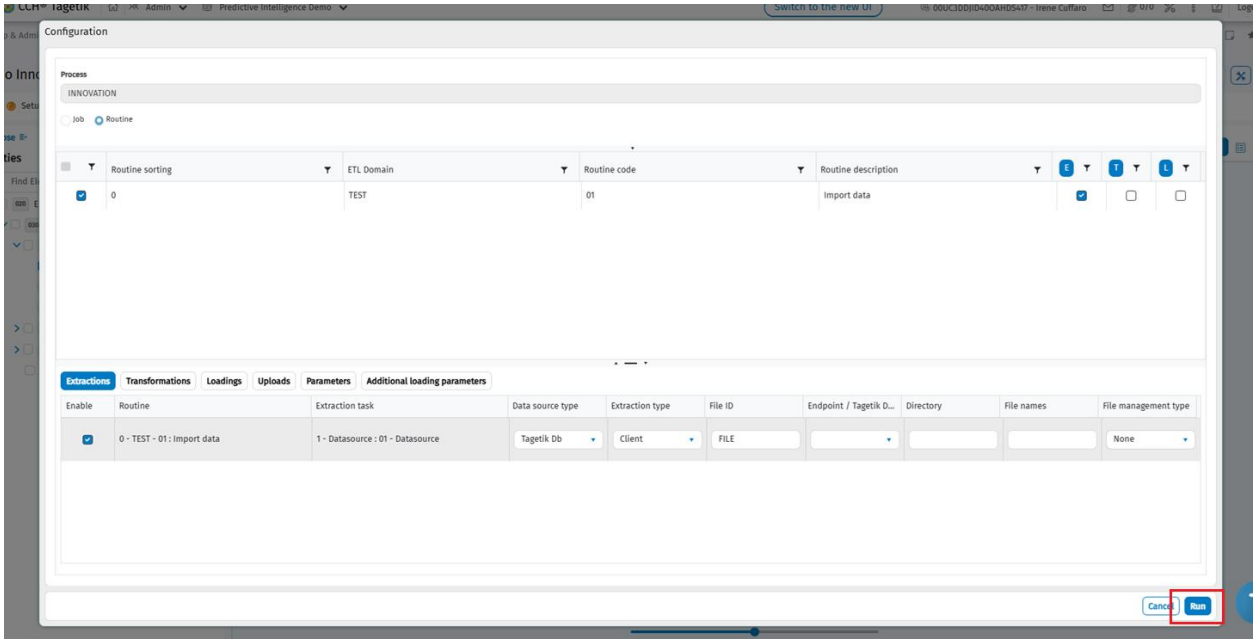

8. Click on the **Save** icon, see that the Mapping Info column will change, then close the report.

9. Click **Import data**.

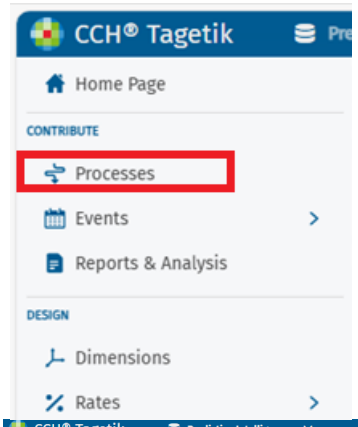

10. Click **Run**, then **Close**.

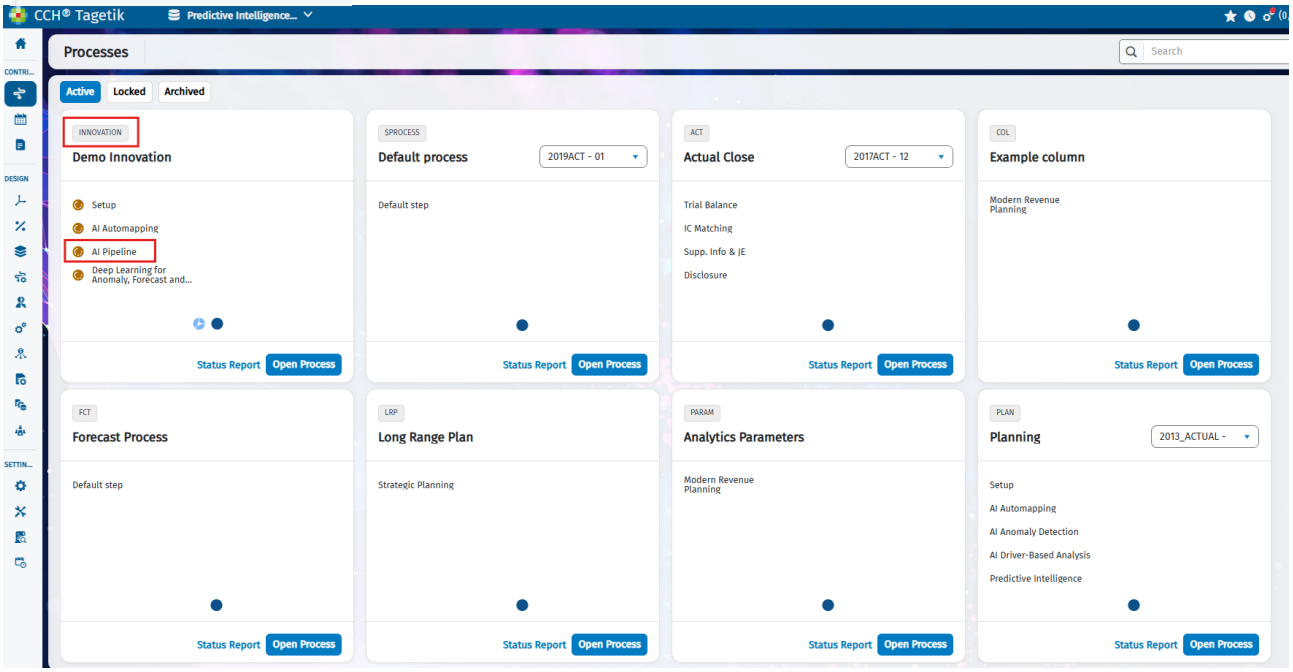

3.AI Pipeline

This procedure trains the financial and non-financial data to analyze the values and determine the most critical drivers for business. It uses the difference between November 2025 and December 2025 Sales Volume as an example for the procedure.

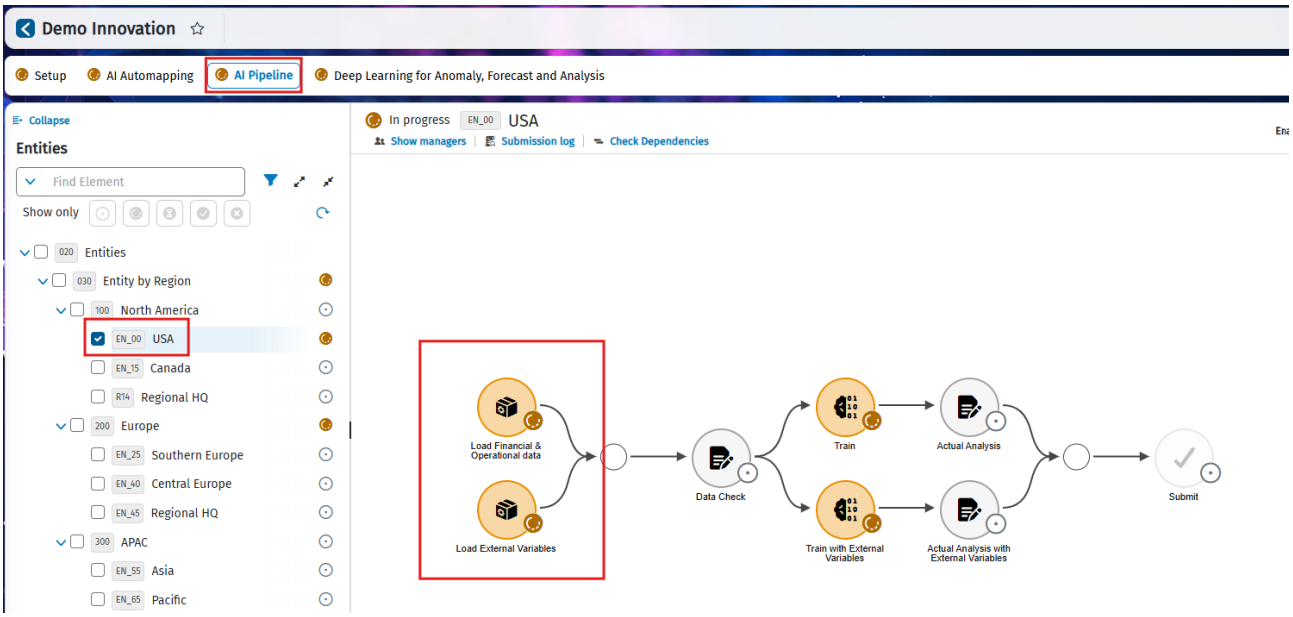

1. From the Setup & Admin Processes section, click the **INNOVATION – Demo Innovation** and click on AI Pipeline

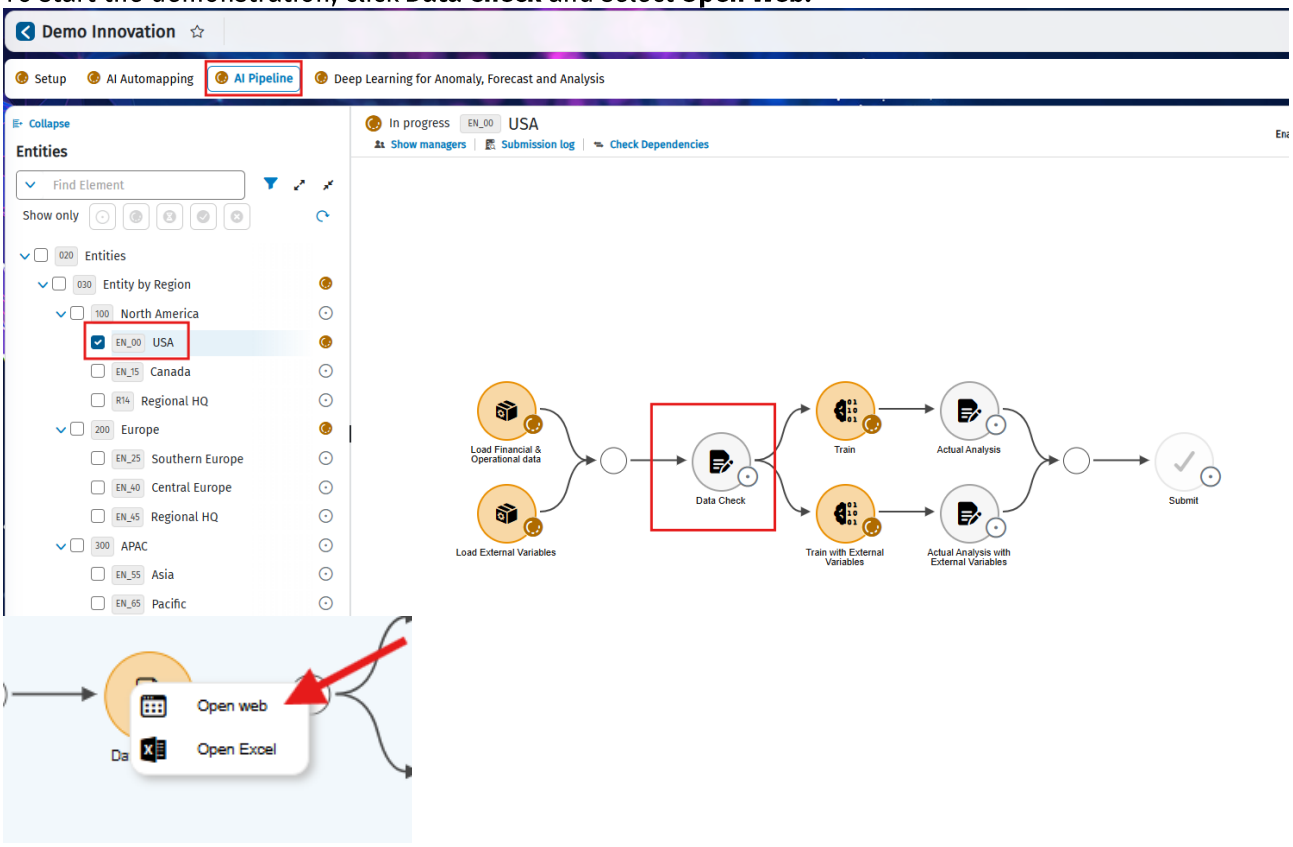

2. 

3. Click **AI Pipeline** and select the **EN_00 – USA** Entity.
4. The AI Pipeline is designed as an admin step. It provides the possibility to upload Financial & Operational data and External Variables (such as Tariffs, the Unemployment Rate and the Inflation

Rate) to support the customer business analysis. If you wish, you can run the DTPs but it is not essential since they have already been executed.

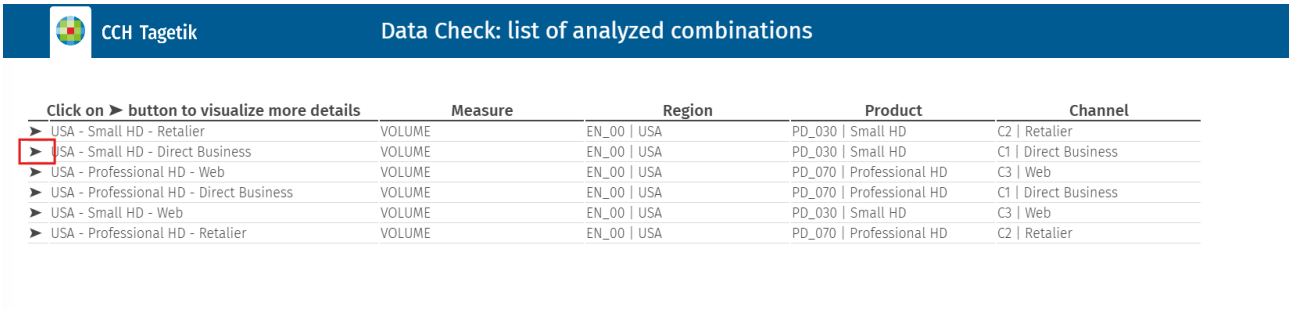

5. To start the demonstration, click **Data Check** and select **Open Web.**

6. The report shows all possible combinations of **Entity, Product, and Channel** for the target variable. You can select the combination whose historical series you want to analyze by clicking the corresponding arrow.

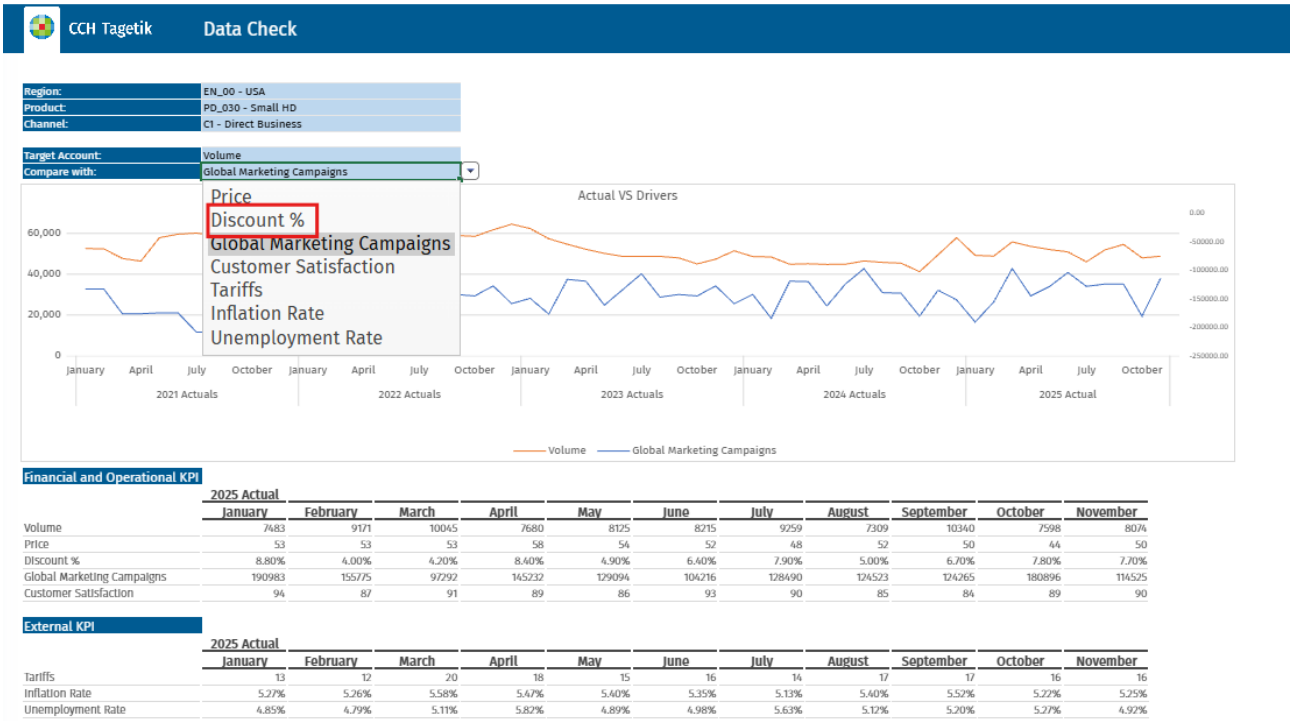

7. Click on ➤ button to select a single combination.

Click on ➤ button to visualize more details	Measure	Region	Product	Channel
➤ USA - Small HD - Retailer	VOLUME	EN_00 | USA	PD_030 | Small HD	C2 | Retailer
➤ USA - Small HD - Direct Business	VOLUME	EN_00 | USA	PD_030 | Small HD	C1 | Direct Business
➤ USA - Professional HD - Web	VOLUME	EN_00 | USA	PD_070 | Professional HD	C3 | Web
➤ USA - Professional HD - Direct Business	VOLUME	EN_00 | USA	PD_070 | Professional HD	C1 | Direct Business
➤ USA - Small HD - Web	VOLUME	EN_00 | USA	PD_030 | Small HD	C3 | Web
➤ USA - Professional HD - Retailer	VOLUME	EN_00 | USA	PD_070 | Professional HD	C2 | Retailer

8. The report shows the volume trend for the last five years (2021 – 2025 (December excluded)) of the selected combination and the values of the KPIs now in the software. We have divided the KPI in Financial & Operational in one table and the External KPI in another. In this way it is possible to analyze all the exogenous variables entered into the system separately.

   Use the drop-down menu to select a driver to compare with the sales units in the chart. For example, you can see other report aspects by changing Global Marketing Campaigns with Discount Percentage

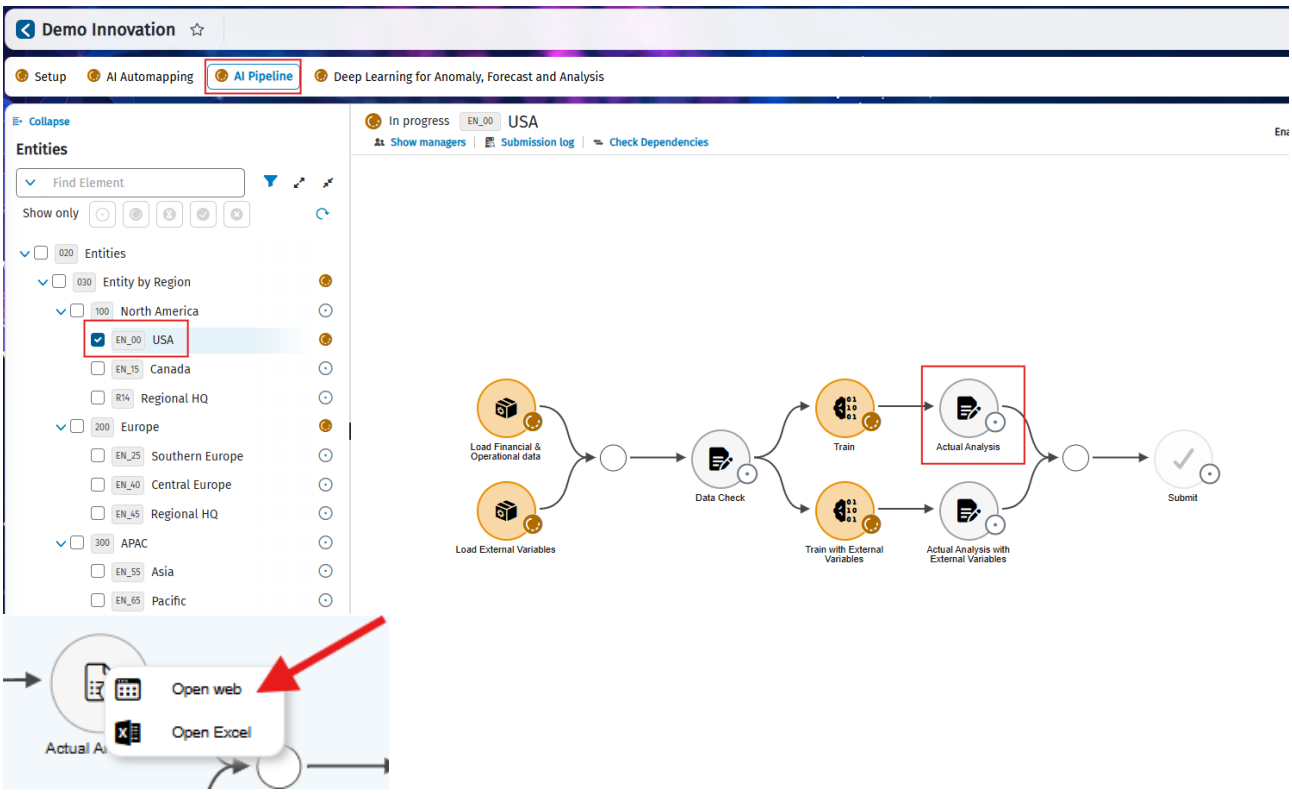

Financial and Operational KPI

	2025 Actual										
	January	February	March	April	May	June	July	August	September	October	November
Volume	7483	9171	10045	7680	8125	8215	9259	7309	10340	7598	8074
Price	53	53	53	58	54	52	48	52	50	44	50
Discount %	8.80%	4.00%	4.20%	8.40%	4.90%	6.40%	7.90%	5.00%	6.70%	7.80%	7.70%
Global Marketing Campaigns	190983	155775	97292	145232	129094	104216	128490	124523	124265	180896	114525
Customer Satisfaction	94	87	91	89	86	93	90	85	84	89	90

External KPI

	2025 Actual										
	January	February	March	April	May	June	July	August	September	October	November
Tariffs	13	12	20	18	15	16	14	17	17	16	16
Inflation Rate	5.27%	5.26%	5.58%	5.47%	5.40%	5.35%	5.13%	5.40%	5.52%	5.22%	5.25%
Unemployment Rate	4.85%	4.79%	5.11%	5.82%	4.89%	4.98%	5.63%	5.12%	5.20%	5.27%	4.92%

9. We have already run the Train Data Processing, so we can move on to opening the "Actual Analysis" report (without external variables) to analyze the results with financial and operational KPIs.

10. The report shows all possible combinations of **Entity, Product, and Channel** for the target variable with the addition of the score values produced by the ML model. It is possible to select the combination whose **training phase results** you want to analyze by clicking the corresponding arrow.

11. Click on ➤ button to select a single combination.

Click on ➤ button to visualize more details	Measure	Region	Product	Channel
➤ USA - Small HD - Direct Business	VOLUME	EN_00 | USA	PD_030 | Small HD	C1 | Direct Business
➤ USA - Small HD - Retailer	VOLUME	EN_00 | USA	PD_030 | Small HD	C2 | Retailer
➤ USA - Professional HD - Retailer	VOLUME	EN_00 | USA	PD_070 | Professional HD	C2 | Retailer
➤ USA - Small HD - Web	VOLUME	EN_00 | USA	PD_030 | Small HD	C3 | Web
➤ USA - Professional HD - Web	VOLUME	EN_00 | USA	PD_070 | Professional HD	C3 | Web
➤ USA - Professional HD - Direct Business	VOLUME	EN_00 | USA	PD_070 | Professional HD	C1 | Direct Business

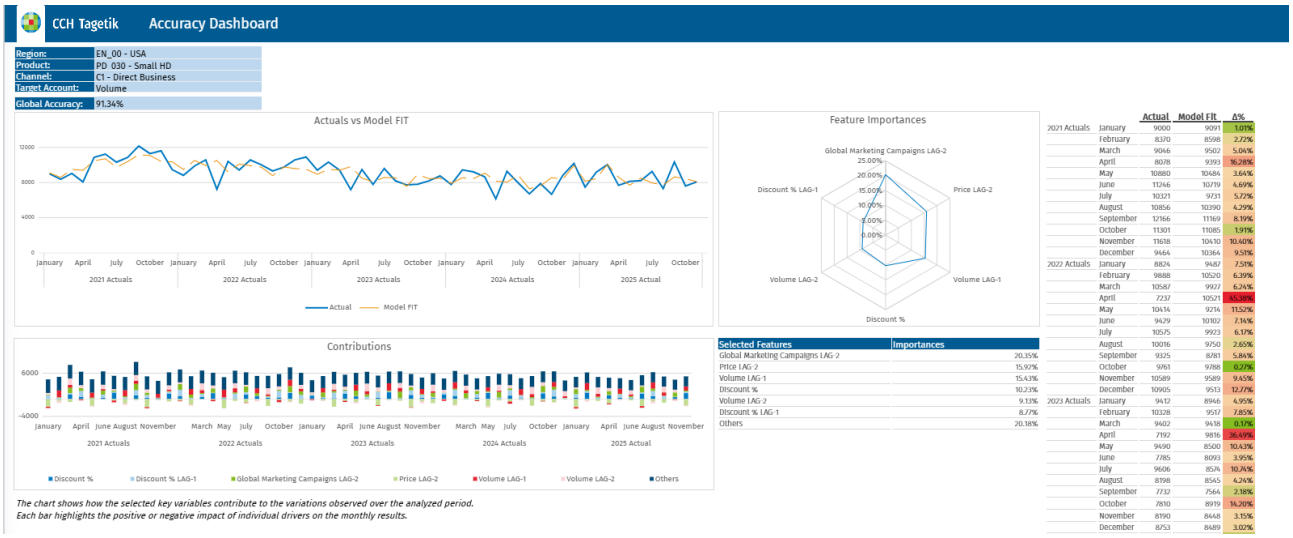

12. The report displays the fit of the last five years (December 2025 excluded), the contribution of the drivers for each period, the drivers importance and the model accuracy. The radar chart shows the global impact of the drivers.

    For example, as you can see in the spider graph, the Global marketing Campaigns (Lag -2) and the Price (Lag -2) are the most significant drivers for this target combination in terms of importance. Price (Lag -2) means if you make some price changes in January, the effect will be felt in March (2 month later).

    The first chart shows the accuracy of the fit: it measures how the projected numbers compare to the actual numbers. The dotted line is the projected numbers, and the solid line represents the actual numbers. In the table on the right we can see the differences in values for every points of actual and fit data. The greater the discrepancy, the closer the delta indicator will be to red.

The chart below displays the impact of the drivers for each data point. A positive impact means an increase in the target variable; and a negative impact means a decrease in the target variable.

In our example, in general the entire time series has a significant value related to "Others," so there is a big impact related to unknown drivers. The Global Accuracy is around 91% and as we can see, there are clear discrepancies between the fit plot (dashed line) and the actual data (solid line).

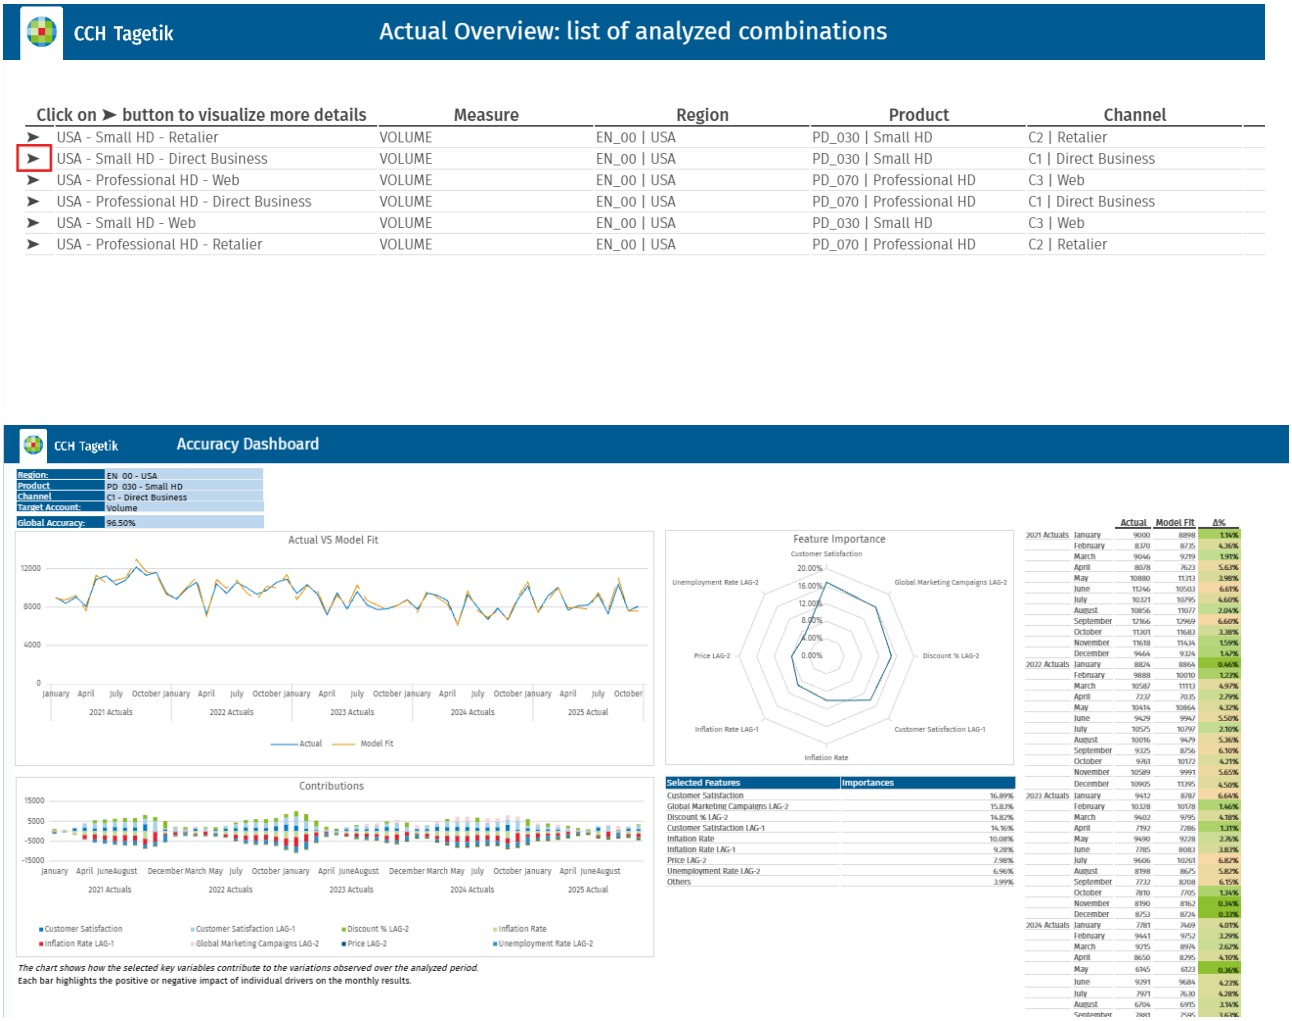

13. Now the user can return to the main page and check whether adding the external variables improves the results of the Actual Analysis . Also in this case we have already run the **Train with External Variables task** so we can move on to opening the "Actual Analysis" report (with external variables) to analyze the results with the external variables added. Select **Open Web**.

14. The report shows all possible combinations of **Entity, Product, and Channel** for the target variable with the addition of the score values produced by the ML model. It is possible to select the combination whose **training phase results** you want to analyze by clicking the corresponding arrow.

15. Click on ➤ button to select the same combination of the example before.

16. The report displays the fit of the last five years (December 2025 excluded), the contribution of the drivers for each period, the drivers importance and the model accuracy. The radar chart shows the global impact of the drivers. The expectation is an improvement over the previous prediction for the last year because now there are new drivers.

    Now, the new drivers can explain what happened in 2025 and the Global Accuracy improved (96%).

    By analyzing the radar chart, we can now see that among the variables impacting the target now there are new variables like Unemployment Rate and Customer Satisfaction.

    The chart below shows the impact of key variables. A positive impact means an increase in the target variable; and a negative impact means a decrease in the target variable.

    The impact related to unknown drivers has decreased and we can generate our disclosure. Obviously, we do not expect to completely replace the OTHERS contribution, but to reach an acceptable trade-off.

    Close the report to return to the first total overview.

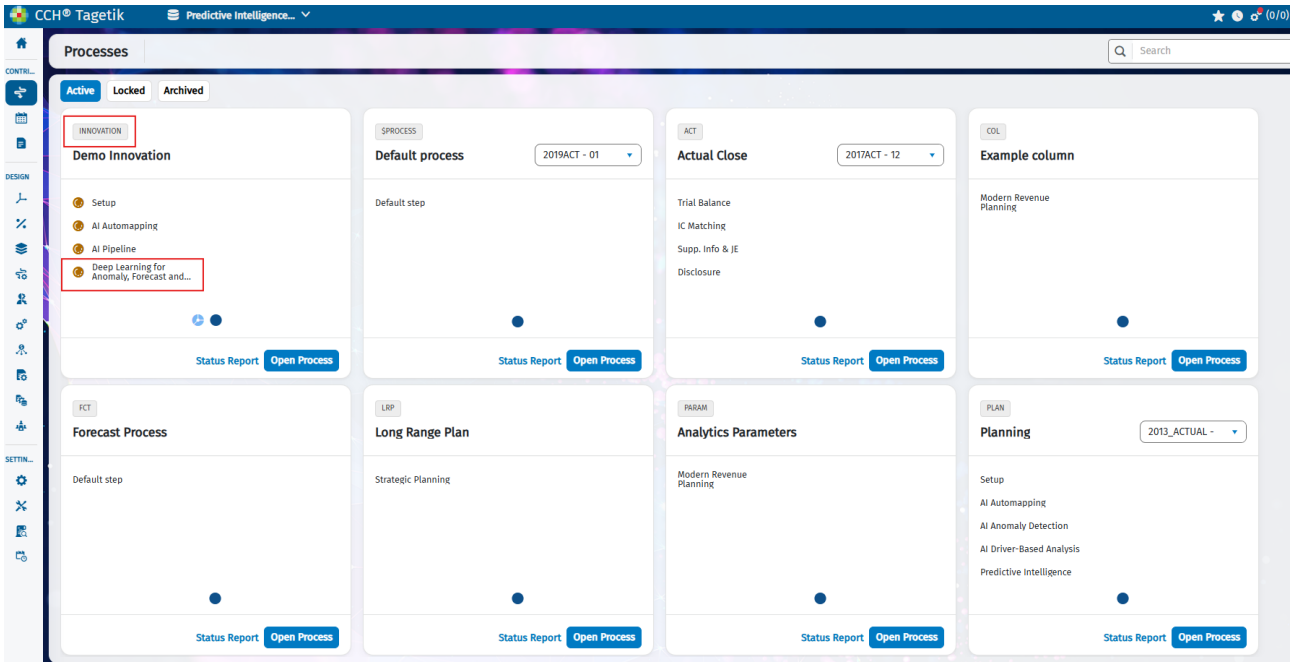

From the Admin side the configuration of Training Data Processing is complete due to great accuracy obtained.

4.Deep Learning for Anomaly, Forecast and Analysis

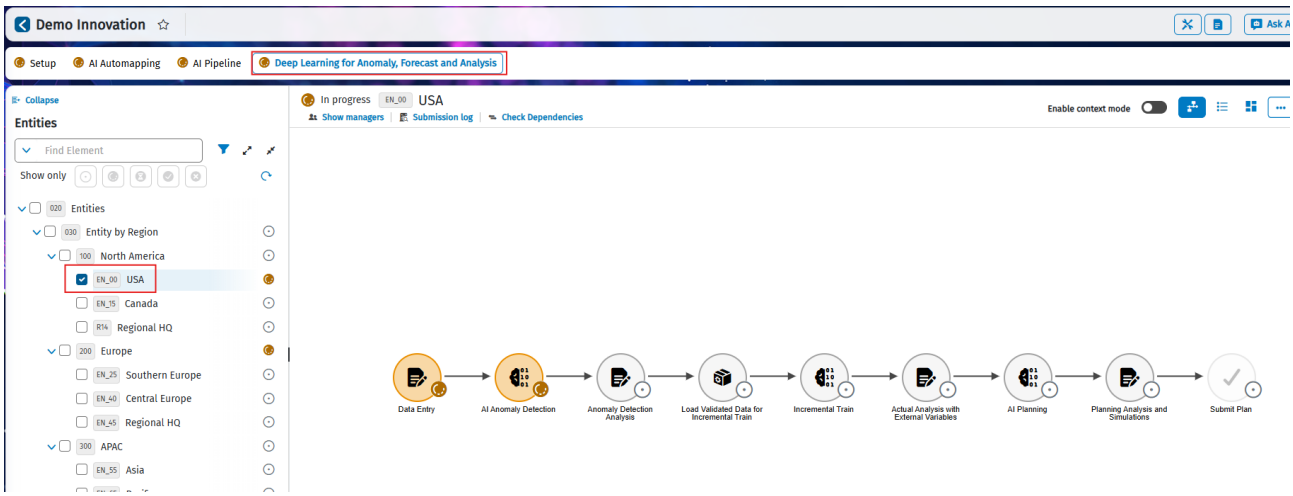

This User step uses the Deep Learning for Anomaly, Forecast, Analysis model to identify anomalies in the December 2025 data and validate the results. The same model also provides a unified framework for Forecast and Driver Analysis, allowing the validated December 2025 data to be incorporated into the model through an incremental training process. This makes it possible to update the model without retraining the entire historical dataset and subsequently generate the 2026 Forecast based on the updated training data.

1. From the Setup & Admin Processes section, click the **INNOVATION – Demo Innovation** and click on Deep Learning for Anomaly, Forecast and Analysis.

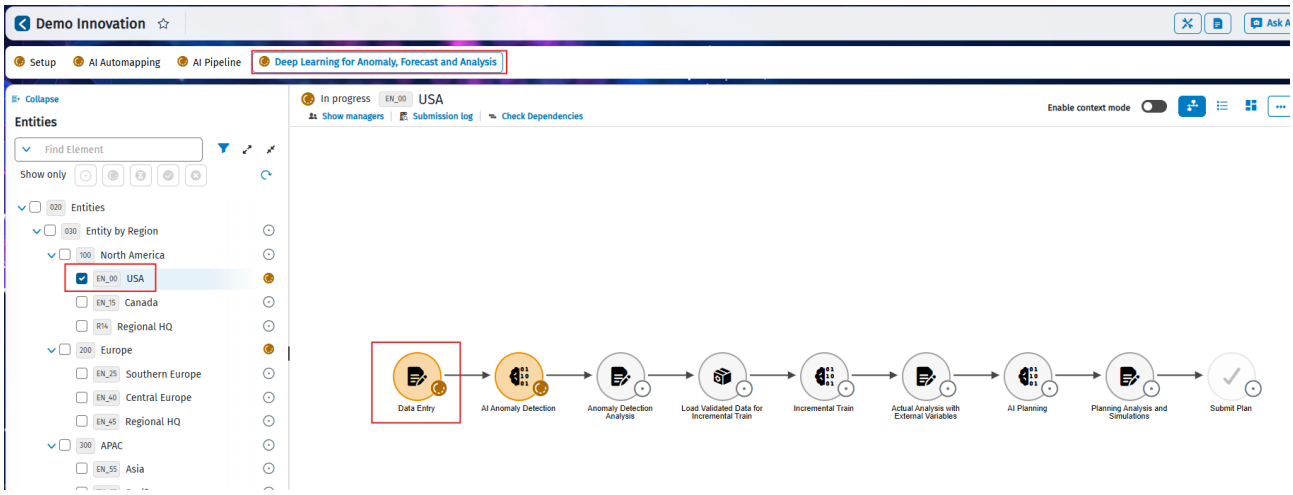

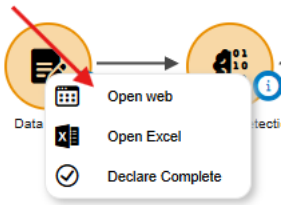

2. The Train step has been already validated by the admin in the AI Pipeline phase. So select the **EN_00 – USA** Entity to start the demonstration from the final user side.

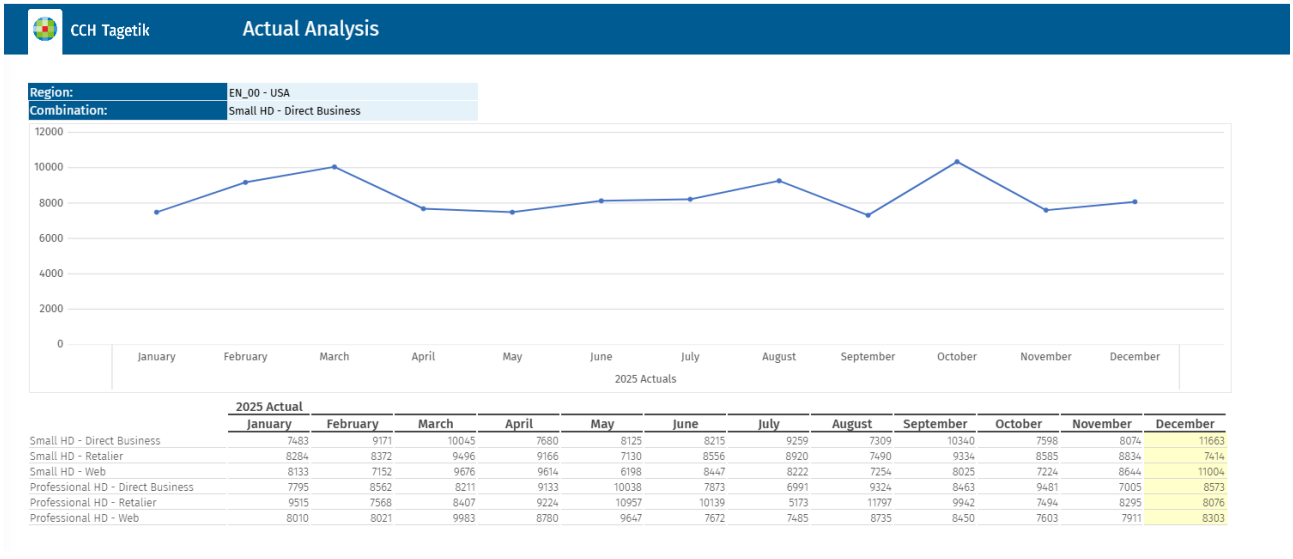

3. Click **Data Entry** and select **Open Web**.

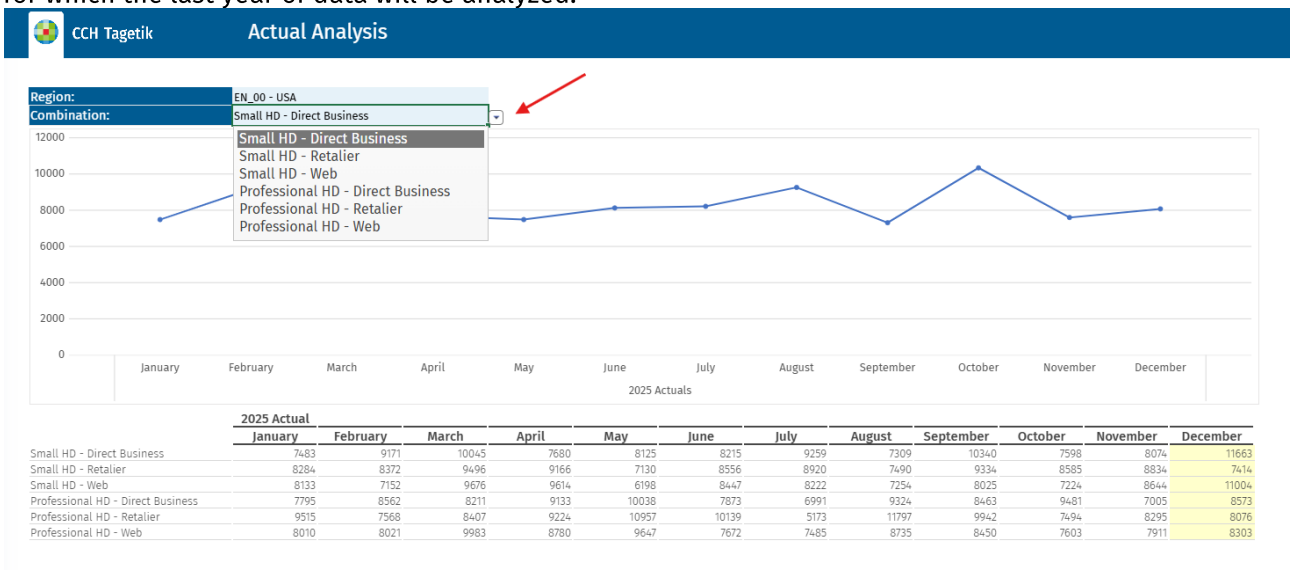

4. The report shows the Volume trend for the last year (2025), the values related to all combinations of Product and Channel for each month of the year 2025, and the last uploaded data for December 2025. The December column is editable, as it contains the values that must be validated before submission.

	2025 Actual											
	January	February	March	April	May	June	July	August	September	October	November	December
Small HD - Direct Business	7483	9171	10045	7680	8125	8215	9259	7309	10340	7598	8074	11663
Small HD - Retalier	8284	8372	9496	9166	7130	8556	8920	7490	9334	8585	8834	7414
Small HD - Web	8133	7152	9676	9614	6198	8447	8222	7254	8025	7224	8644	11004

5.

6. By clicking on the dropdown menu it is possible to select the Product and Channel combination for which the last year of data will be analyzed.

	2025 Actual											
	January	February	March	April	May	June	July	August	September	October	November	December
Small HD - Direct Business	7483	9171	10045	7680	8125	8215	9259	7309	10340	7598	8074	11663
Small HD - Retalier	8284	8372	9496	9166	7130	8556	8920	7490	9334	8585	8834	7414
Small HD - Web	8133	7152	9676	9614	6198	8447	8222	7254	8025	7224	8644	11004
Professional HD - Direct Business	7795	8562	8211	9133	10038	7873	6991	9324	8463	9481	7005	8573
Professional HD - Retalier	9515	7568	8407	9224	10957	10139	5173	11797	9942	7494	8295	8076
Professional HD - Web	8010	8021	9983	8780	9647	7672	7485	8735	8450	7603	7911	8303

7. We have already run the AI Anomaly Detection task (it takes several minutes), so you do not need to run this task, and you can directly click **Anomaly Detection** and select **Open Form in Web**

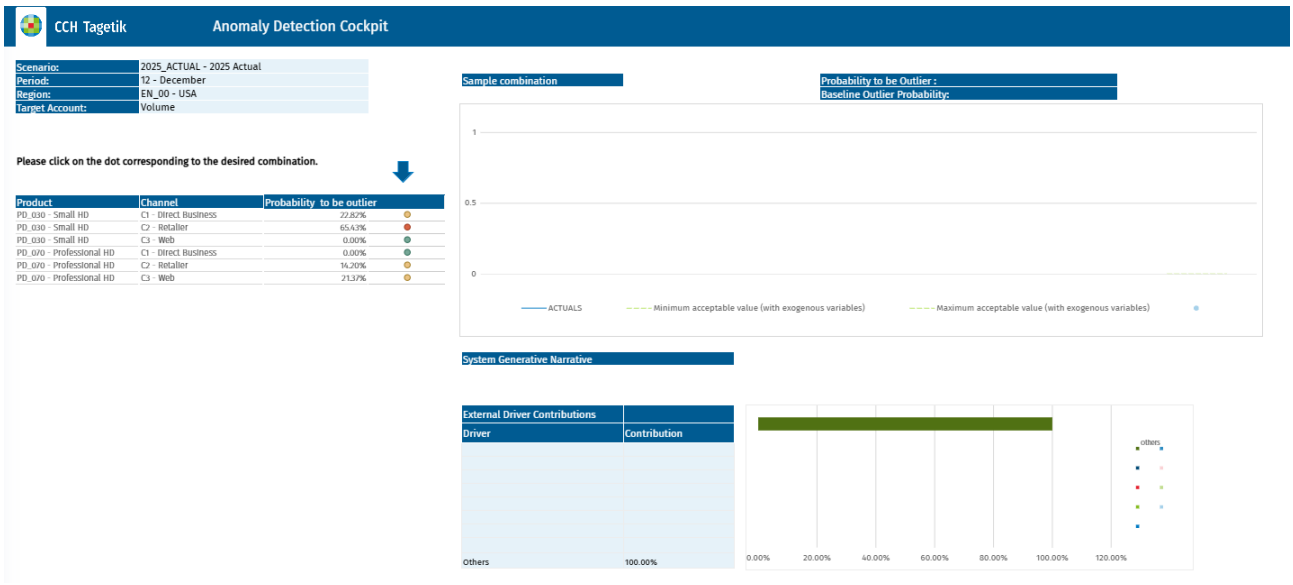

3. Select the following parameters and click **OK**:

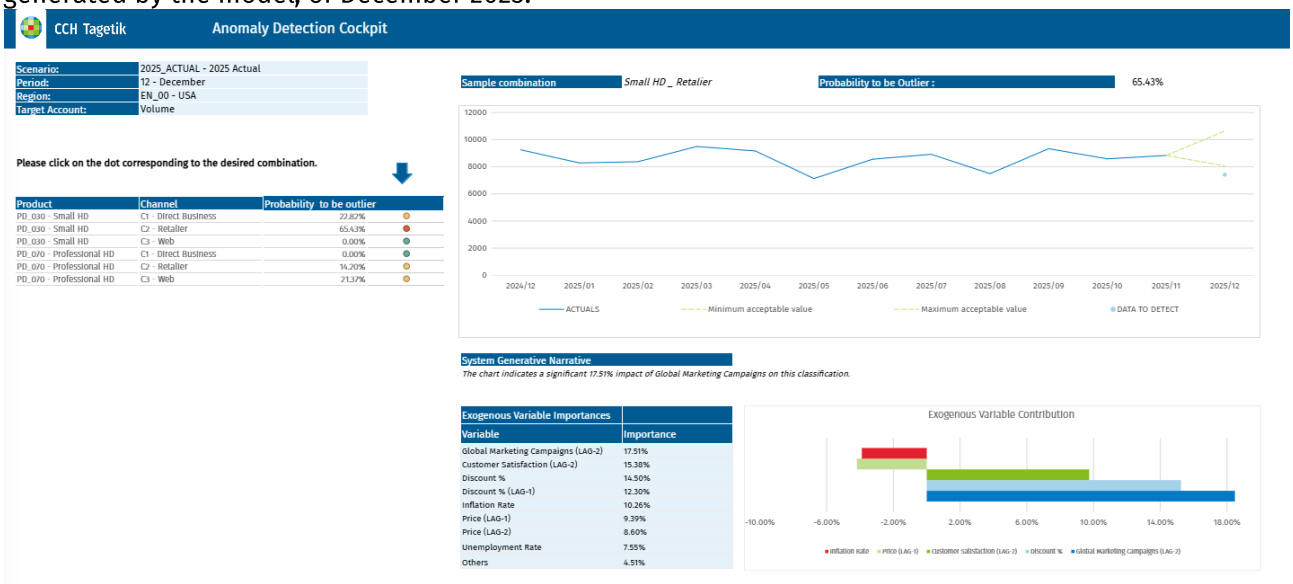

- Entity = EN_00 – USA
- PRODUCT = ALL-All Product
- CHANNEL = ALL – ALL

8. The report shows identified outliers and inliers. For example, the USA Region, with a Channel Retailer and Product of Small HD, has a probability to be an outlier of 65.4%. On the other side, the USA Region, with a Channel Web and Product of Small HD has a zero probability to be an outlier, so it will be consider as an inlier. Click on the dot to see the details a combination.

9. The first graph shows a blue point as an outlier that is out of the acceptable values range, generated by the model, of December 2025.

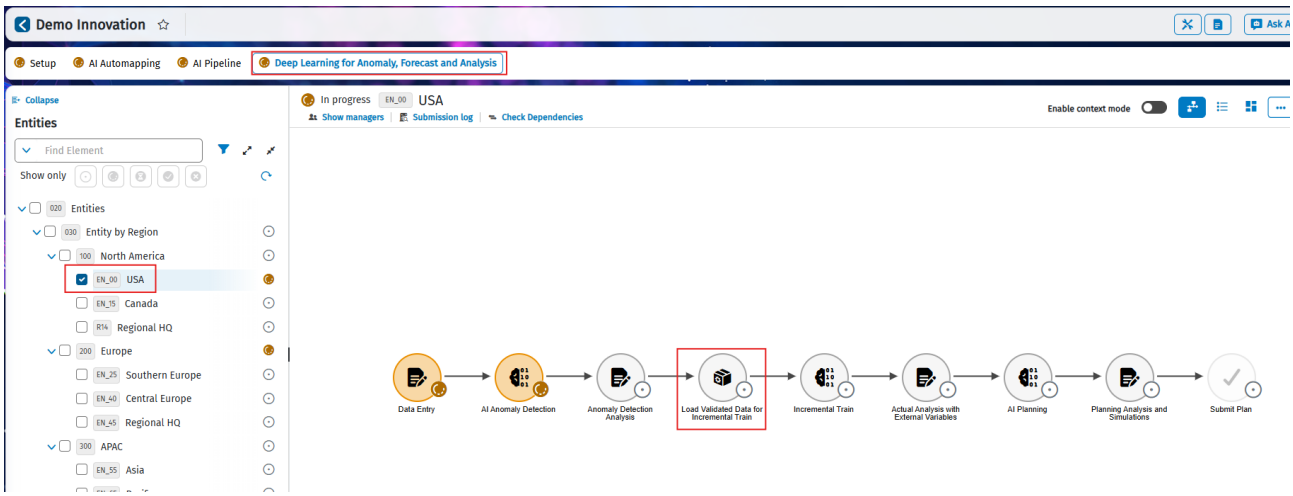

10. In the chart below you can see the contribution that each exogenous variable gives to modifying the probability to be outlier (starting from the base case without considering the exogenous variables) while in the table there's the list of importances (in percentage) of the most impactful exogenous drivers.

    The December 2025 point is an outlier with a probability of 65.4%. However, the introduction of the external drivers had a strong impact (Global Marketing Campaigns and Customer Satisfaction in particular) and, since we expected to sell more, the point is now classified as anomalous.

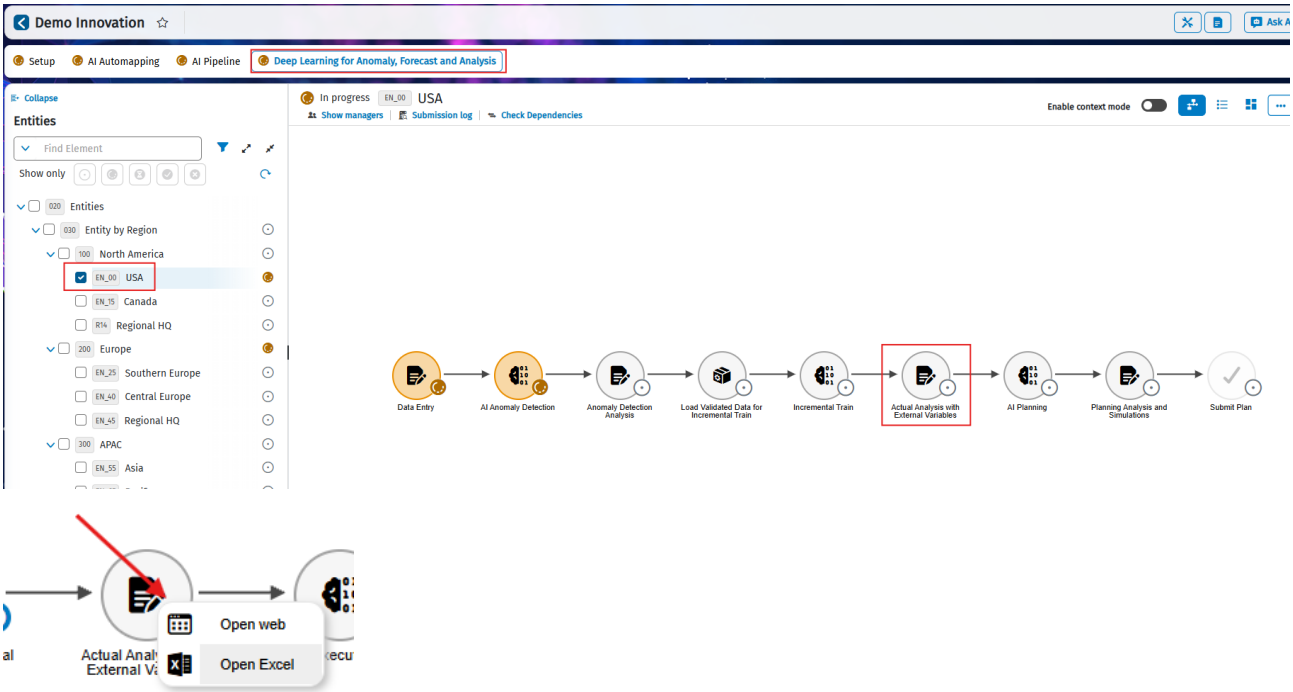

11. Anomalies detected by the system are not automatically corrected. The final decision remains with the user, who can choose whether to adjust the values identified as anomalous or proceed with the analysis using the existing data

12. Once the analysis is complete, run the **Load Validated Data for Incremental Train** task to import and submit the validated December 2025 data.

13. 

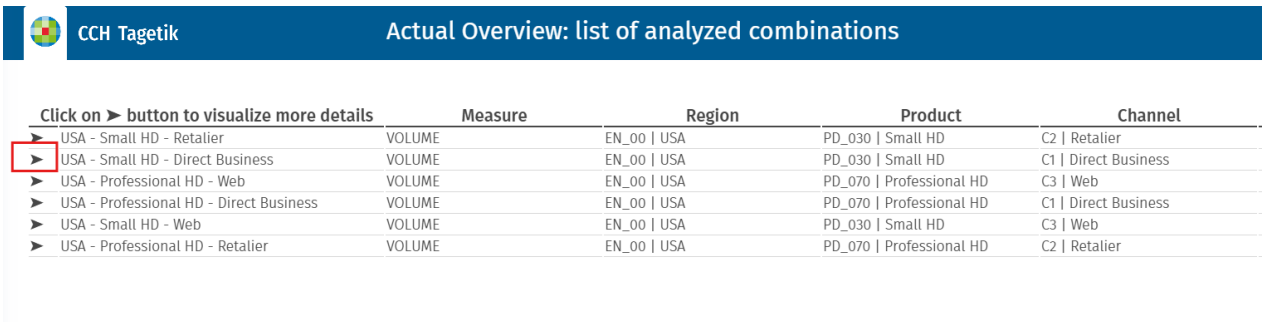

14. The model is now ready for the **Incremental Train** process. This process retrains the model using only the newly validated data for December 2025, instead of retraining it on the entire historical time series. By training only the incremental data, the model runs faster while reducing processing time and computational costs.

15. We have already run the incremental Train Data Processing so we can move on to opening the "Actual Analysis with External Variables" report to analyze the results with financial and operational KPIs.

16. The report shows all possible combinations of **Entity, Product, and Channel** for the target variable. It is possible to select the combination whose **training phase results** you want to analyze by clicking the corresponding arrow.

17. Click on ➤ button to select a single combination.

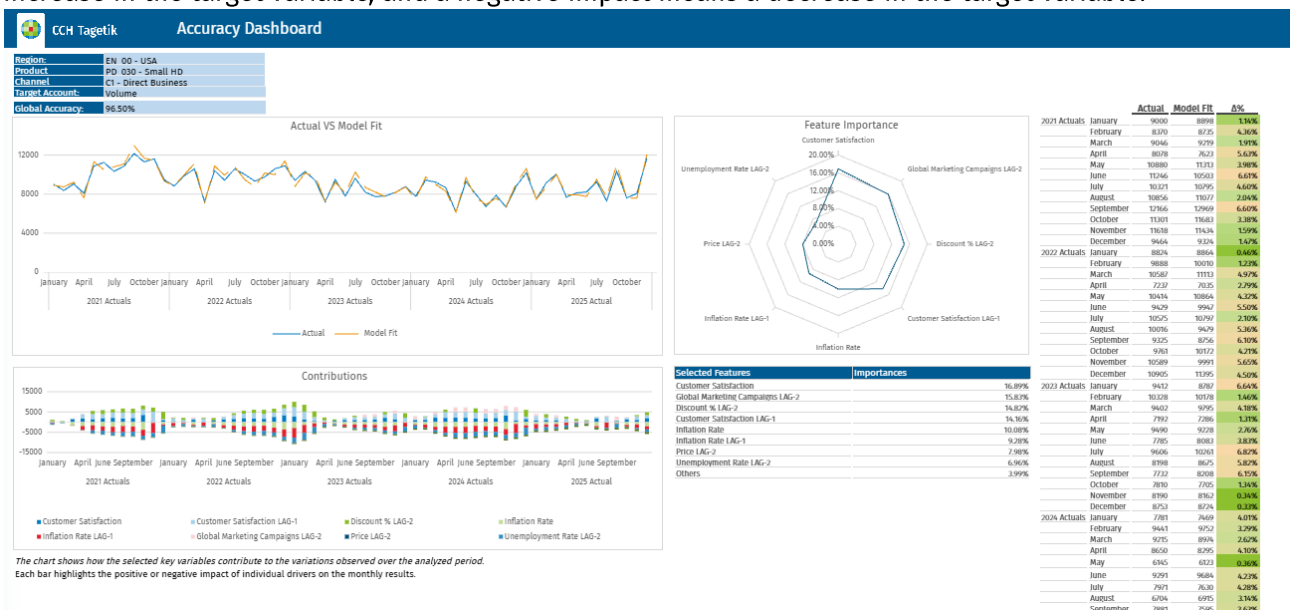

18. The report displays the fit of the last five years (now with December 2025 included), the contribution of the drivers for each period, the drivers importance and the model accuracy. The radar chart shows the global impact of the drivers.

    For example, as you can see in the spider graph, the Global marketing Campaigns (Lag -2) and the Customer Satisfaction are the most significant drivers for this target combination in terms of importance. As you can see, the list of driver importances slightly changed: it is due to the addition of December 2025 value.

    The first chart shows the accuracy of the fit: it measures how the projected numbers compare to the actual numbers. The dotted line is the projected numbers, and the solid line represents the actual numbers.

    The chart below displays the impact of the drivers for each data point. A positive impact means an increase in the target variable; and a negative impact means a decrease in the target variable.

19. Now the user can return to the main page . We have already run the **AI Planning** Data Processing so click the **Planning Analysis and Simulations** report and select **Open Web** to see the forecasted values.

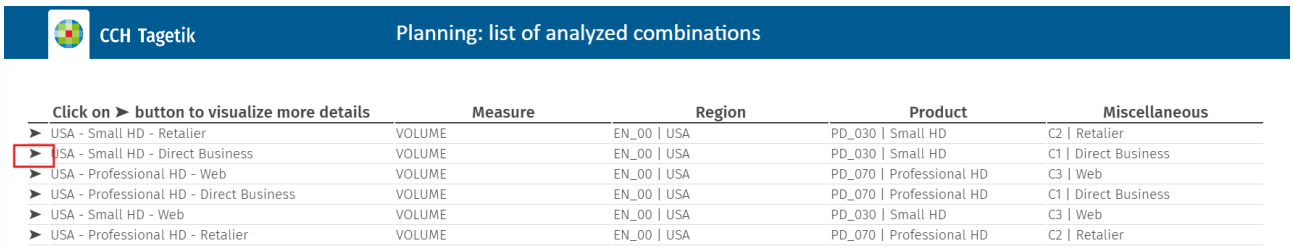

20. The report shows all possible combinations of **Entity, Product, and Channel** for the target variable. It is possible to select the combination whose **training phase results** you want to analyze by clicking the corresponding arrow.

Click on ➤ button to visualize more details	Measure	Region	Product	Miscellaneous
➤ USA - Small HD - Retalier	VOLUME	EN_00 | USA	PD_030 | Small HD	C2 | Retalier
➤ USA - Small HD - Direct Business	VOLUME	EN_00 | USA	PD_030 | Small HD	C1 | Direct Business
➤ USA - Professional HD - Web	VOLUME	EN_00 | USA	PD_070 | Professional HD	C3 | Web
➤ USA - Professional HD - Direct Business	VOLUME	EN_00 | USA	PD_070 | Professional HD	C1 | Direct Business
➤ USA - Small HD - Web	VOLUME	EN_00 | USA	PD_030 | Small HD	C3 | Web
➤ USA - Professional HD - Retalier	VOLUME	EN_00 | USA	PD_070 | Professional HD	C2 | Retalier

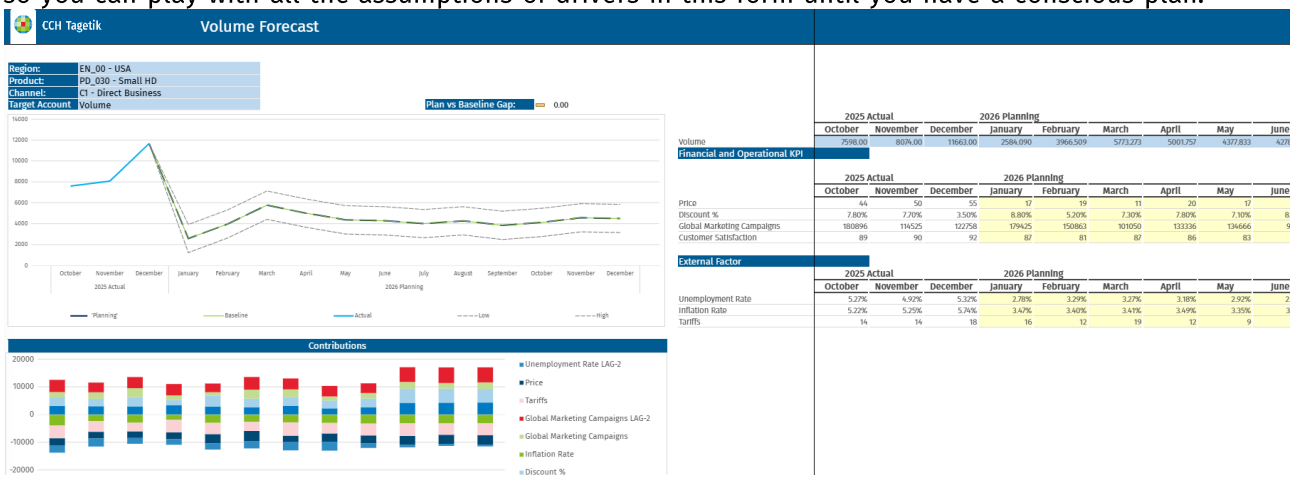

21. The report shows all possible combinations of **Entity, Product, and Channel** for the target variable. It is possible to select the combination whose **training phase results** you want to analyze by clicking the corresponding arrow.

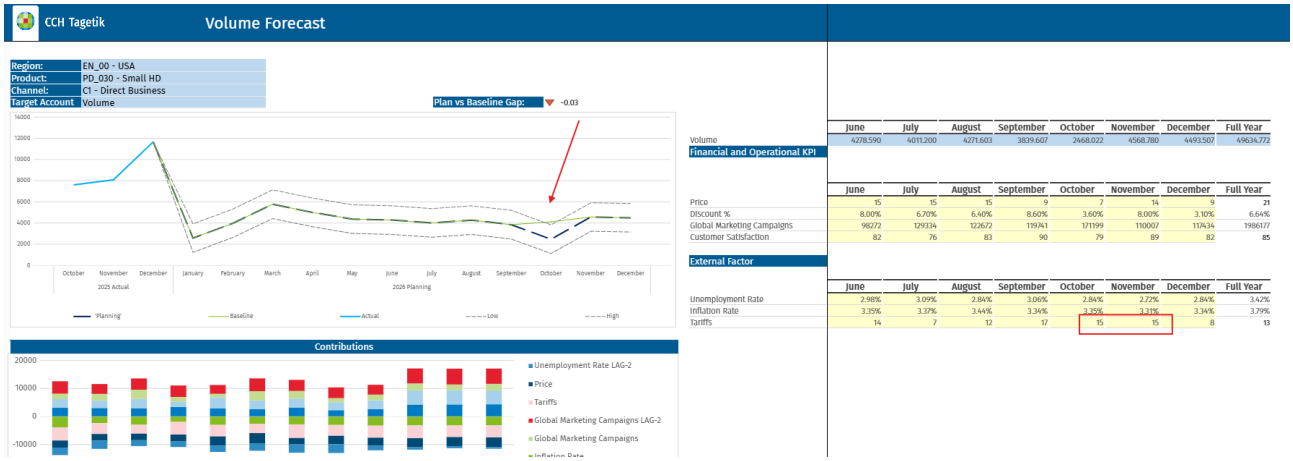

Click on ➤ button to visualize more details	Measure	Region	Product	Miscellaneous
➤ USA - Small HD - Retalier	VOLUME	EN_00 | USA	PD_030 | Small HD	C2 | Retalier
➤ USA - Small HD - Direct Business	VOLUME	EN_00 | USA	PD_030 | Small HD	C1 | Direct Business
➤ USA - Professional HD - Web	VOLUME	EN_00 | USA	PD_070 | Professional HD	C3 | Web
➤ USA - Professional HD - Direct Business	VOLUME	EN_00 | USA	PD_070 | Professional HD	C1 | Direct Business

➤ USA - Professional HD - Retalier	VOLUME	EN_00 | USA	PD_070 | Professional HD	C2 | Retalier

22. Click on ➤ button to select a single combination.

23. The report shows the mean value of your prediction and the accuracy: the lower value of the prediction is the lower line and the higher value will be the higher line. The yellow cells are editable so you can play with all the assumptions of drivers in this form until you have a conscious plan.

24. For example, this report highlights tariffs as a key external driver, which is outside our control. We can therefore assume that the value related to tariffs will increase for October and November and apply a value of 15 for all these months. As a result, the planned scenario shows a decrease compared to the Baseline

25. To mitigate this impact, we can revise the Discount Policy by setting a value of 30% in October and the Global Marketing Campaigns by setting a value of 400k.

26. The charts below show the impact of key variables. In the first one is possible to see the contributions of the exogenous variables for each data point. A positive impact means an increase in the target variable; and a negative impact means a decrease in the target variable. The second view displays the variables whose overall impact is the most significant for the selected target combination.
