Best practices – OData API

In production environments the OData APIs exposed by CCH Tagetik have a set timeout of 10 minutes. To avoid reaching this timeout, here are some best practices.

- If the exposed service has some input parameters (Process, Scenario, Period, Entity) it is recommended to specify one or more values for each parameter, avoiding the use of the '*$ALL*' syntax.
- If not all the dataset fields are necessary, it is possible to extract a subset of fields using the *select* syntax in the query options (e.g. ?$select=OID,ACCOUNT,COST_CENTER)
- To further limit the data, it is possible to use the *filter* syntax in the query options (e.g. ?$filter=Account eq '01')
- When managing a large amount of data, it is possible to use client side pagination in the query options (e.g. ?$top=1000&$skip=1000)

All these optimizations can also be used together.
