How to do to Create New Entity CCH® Tagetik

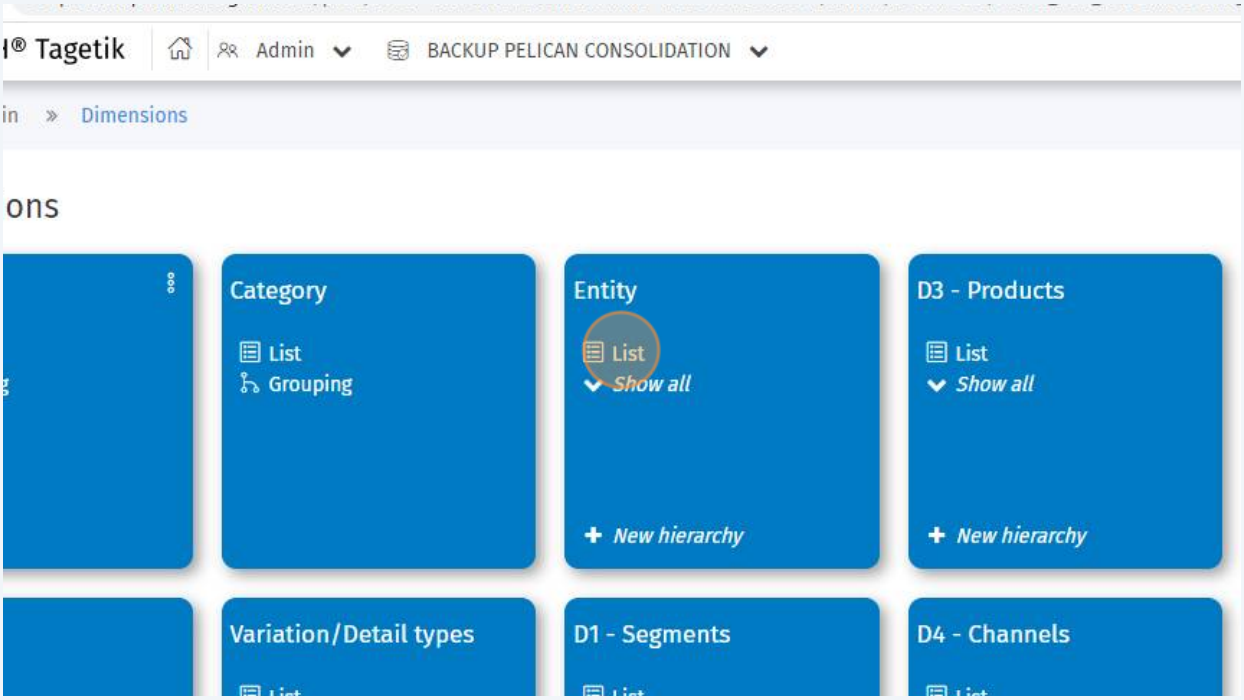

Steps to create an entity: Considerations to be taken into account in process flows, user rights, ORS, data integration.

Create an Entity from Dimension Entity

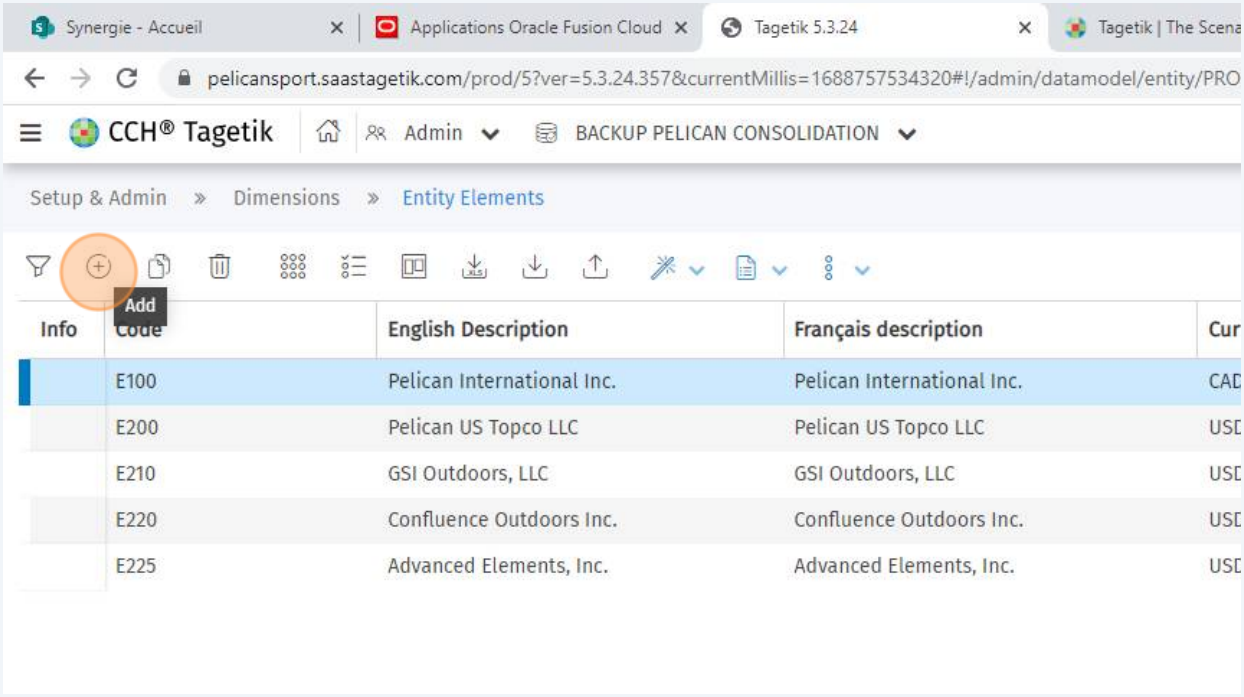

1 Click on connect with credentials.

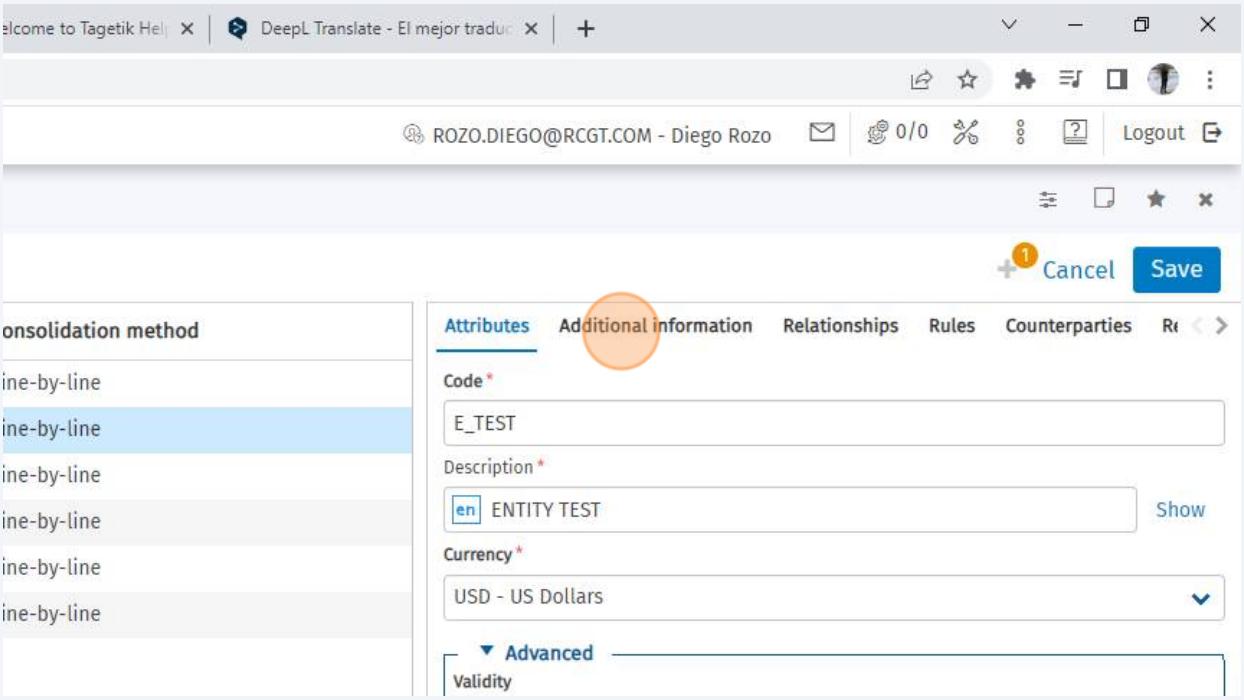

2 Create the entity from the path Dimensions " Entity " List

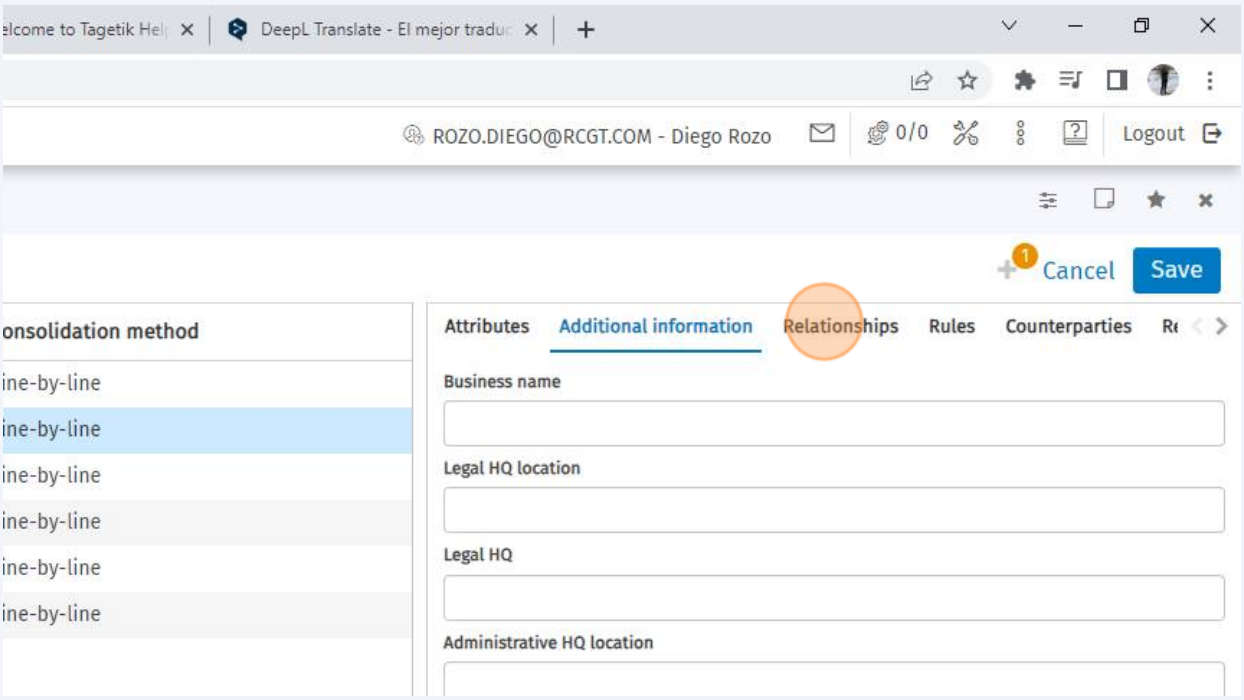

3 Select the plus icon to add or the clone symbol to take an entity as a reference and keep its attributes.

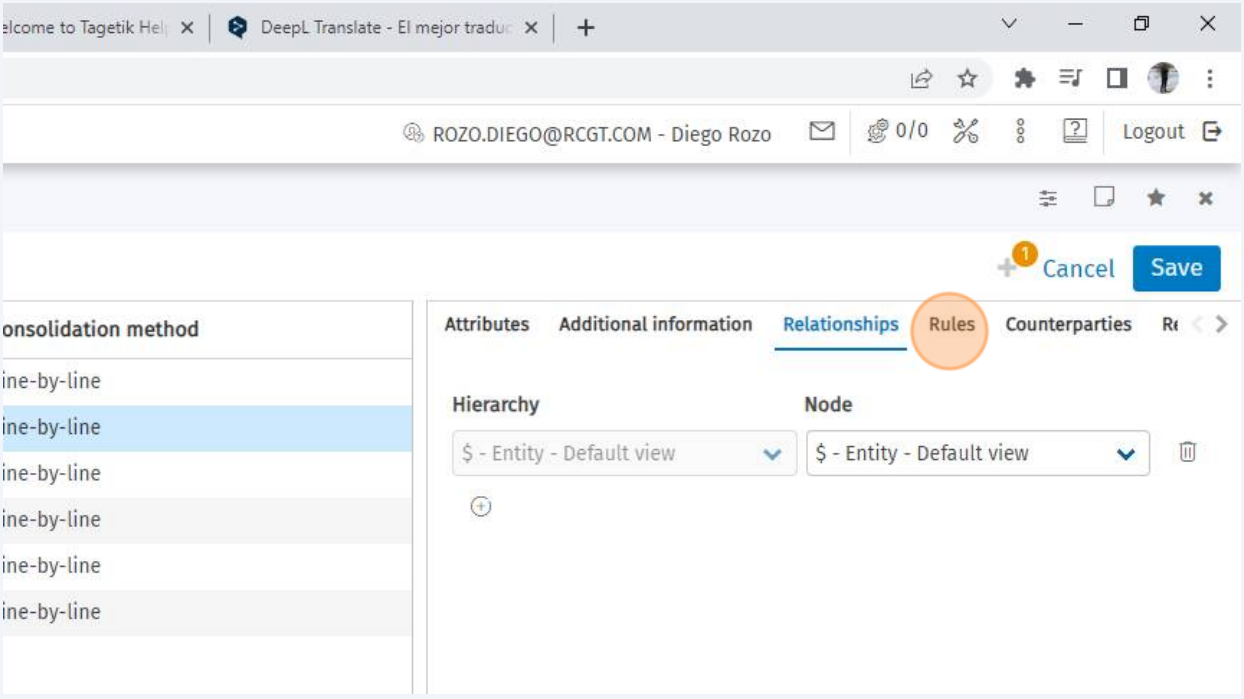

4 Fill in the fields of the attributes tab. This will allow you to identify the company under a specific ID, its description and the company's currency and start dated/end date, because this inhibits the data entry on an entity before its start date and after its end date. Click After this, go to the next tab "Additional information"

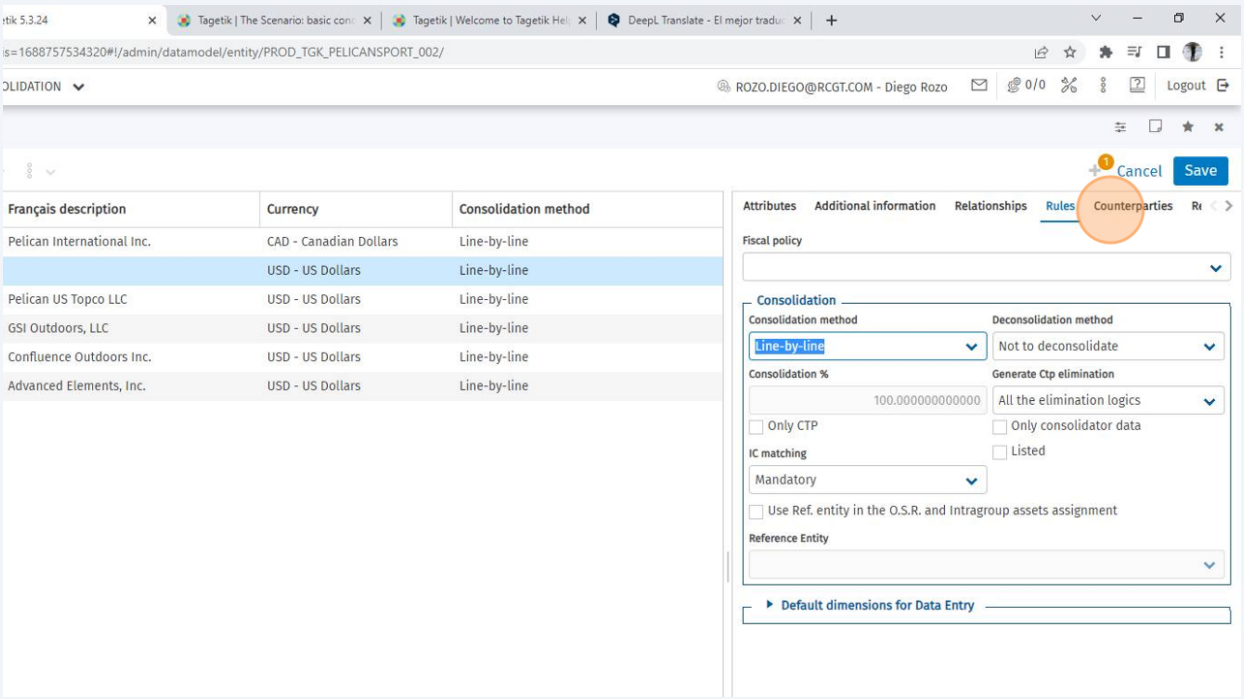

5 It is important to have the complete information of the companies to fill in each of the tabs. After this, go to the next tab "Relationships"

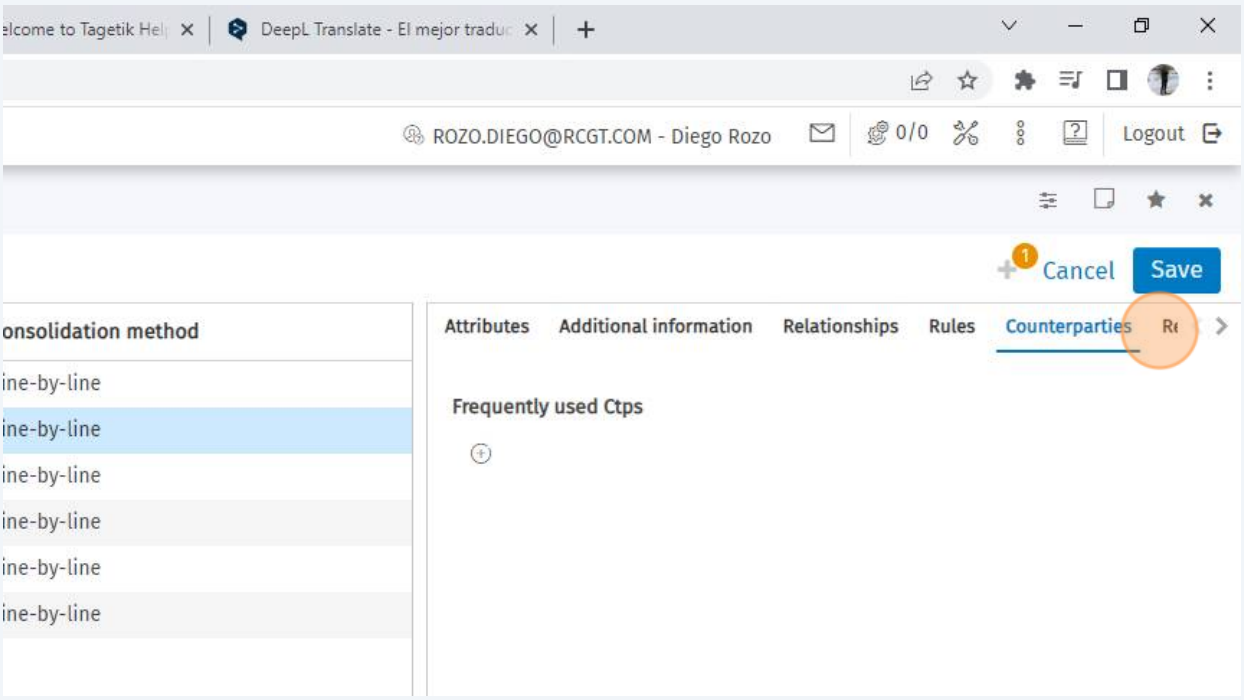

6 In the "Relationships" tab we can assign the entity to a hierarchy that we are going to use. There can be several hierarchies. After this, go to the tab "Rules"

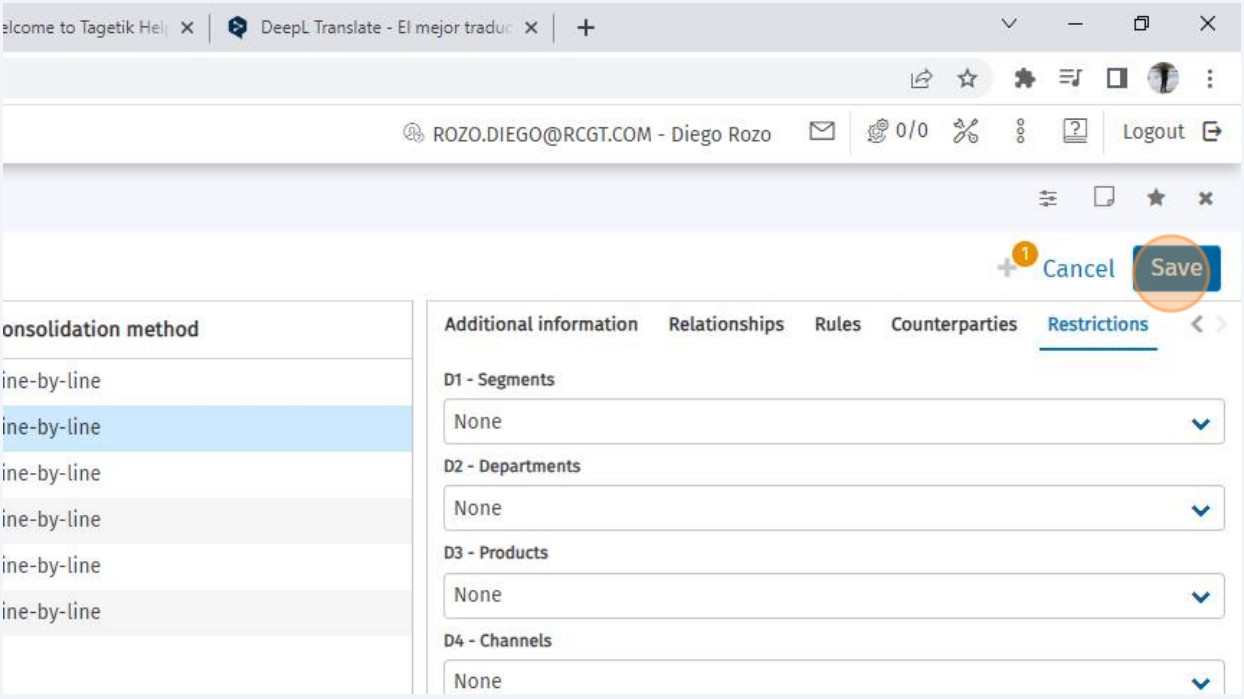

7 In the "Rules" tab we have to inform relevant points for our Consolidation process. Firstly, it is the method we are going to use for our consolidation process, where here we can see "Equity, Proportional, line by line and cost method". This is based on the information of the corporate group structure. Secondly, we establish the % shareholding that each company has. Thirdly we set whether to generate eliminations, whether to exclude IC transactions or none of the above and finally we must select whether the entity should match IC transactions. After this, go to the tab "Counterparties"

8 When there is a large number of entities in the application , during the IC data entry it could be useful to display only the most used counterparties available for each entity. After this, go to the tab "Restrictions"

9 This tab allows you to set restrictions for an element of one of the custom dimensions. Is usedful for creating reports containing information about specific custom dimensions managed for the entities listed. After this, go to "Save"

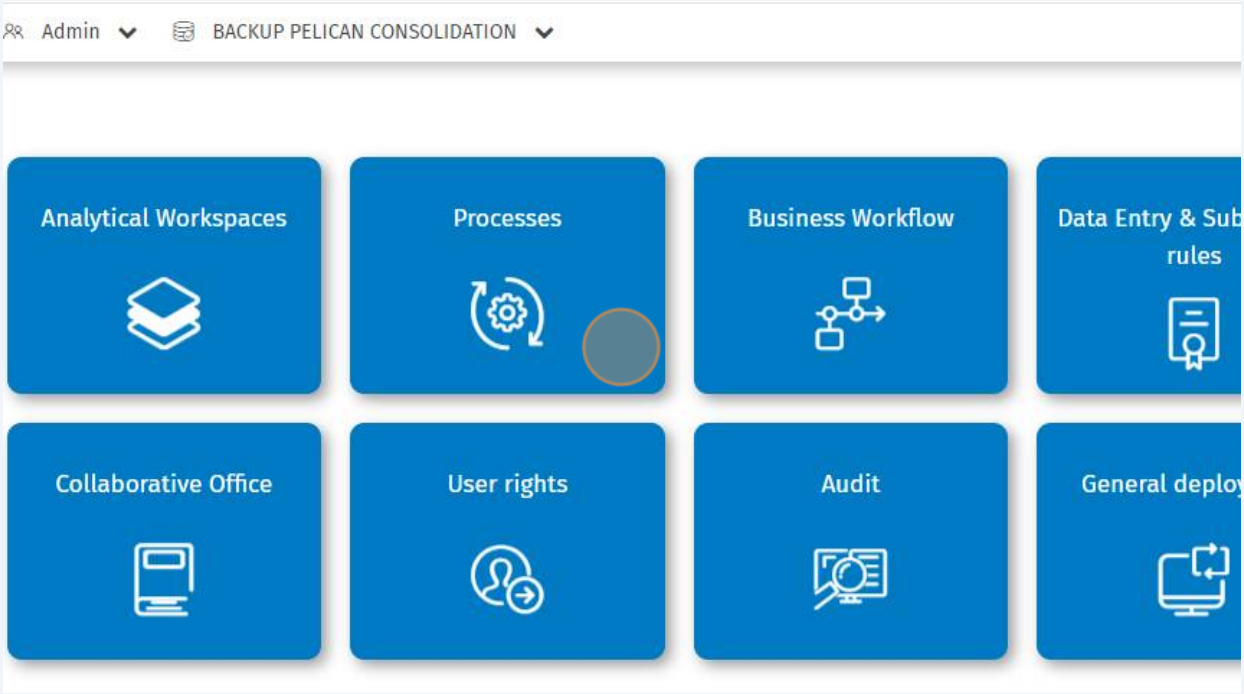

10 Once the entity has been created, we must launch the option on the "General Deployment" icon to synchronise the information at system and report level.

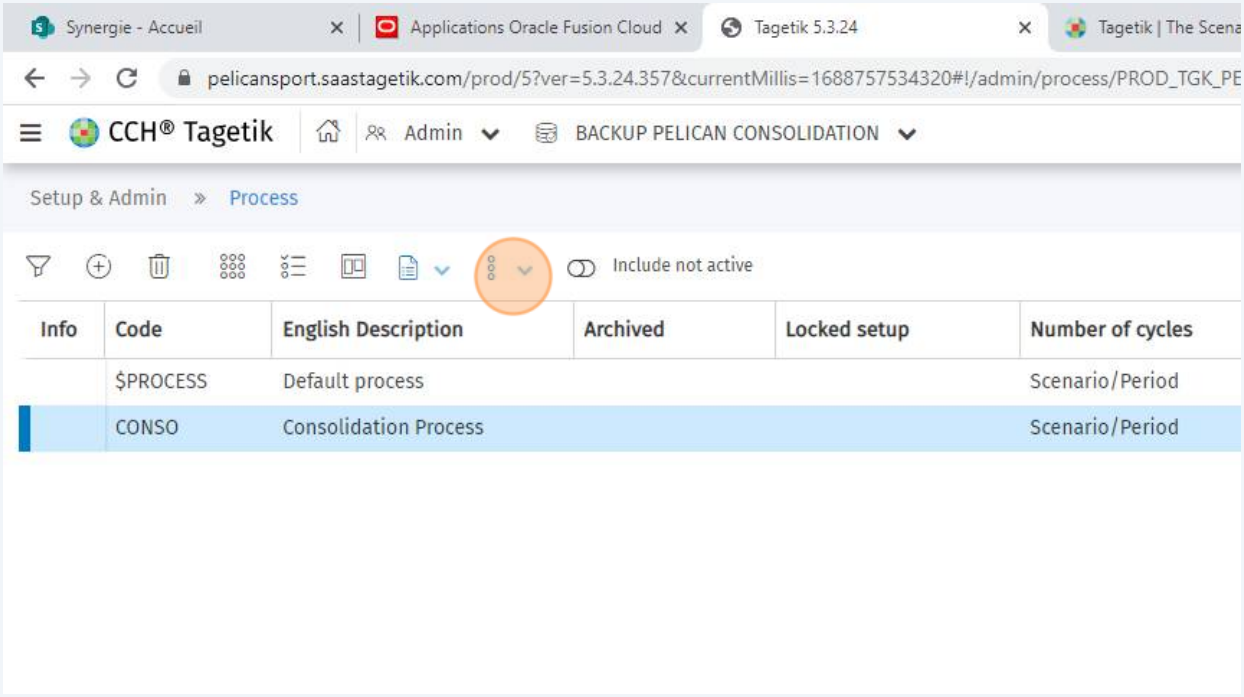

From "Process Definition" confirm the previously created company is found.

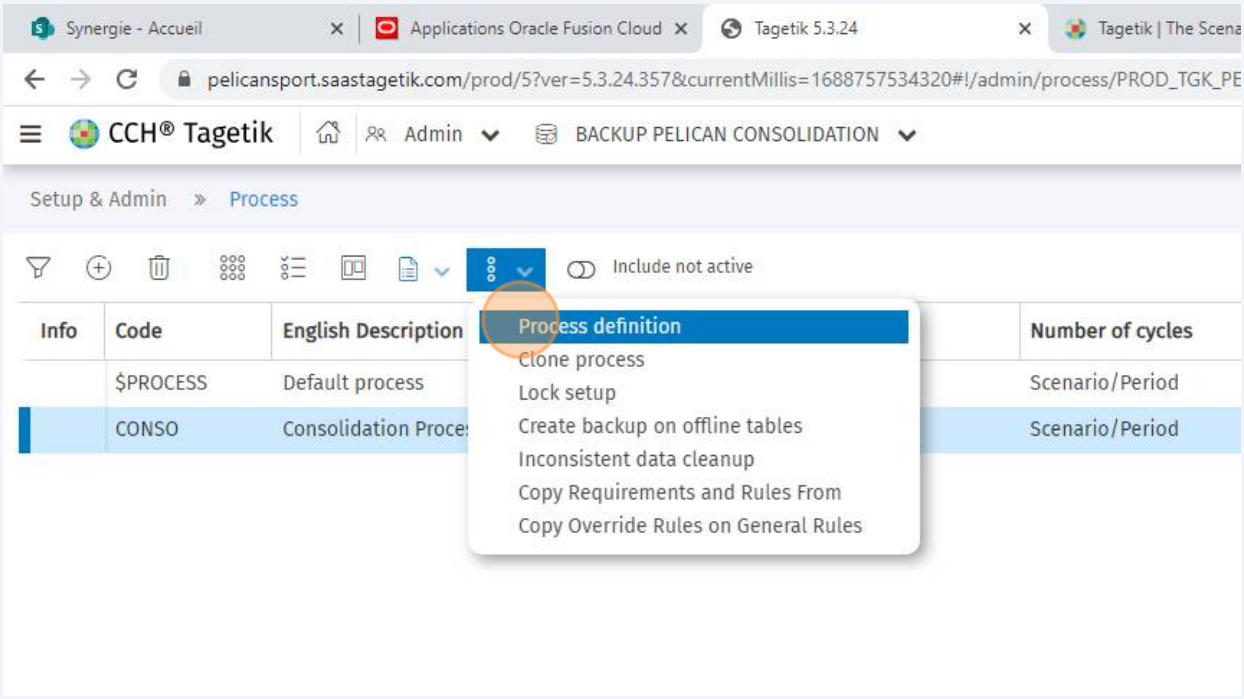

11 Go to the "Processes"

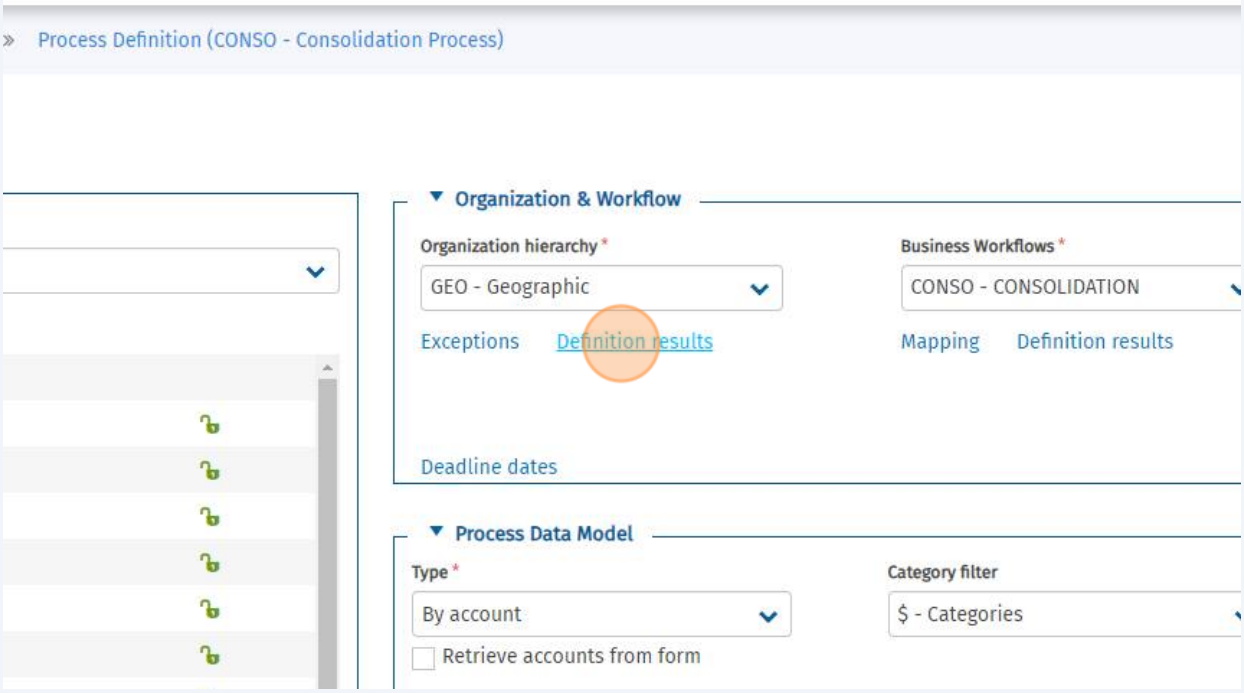

12 Select "CONSO" Processes

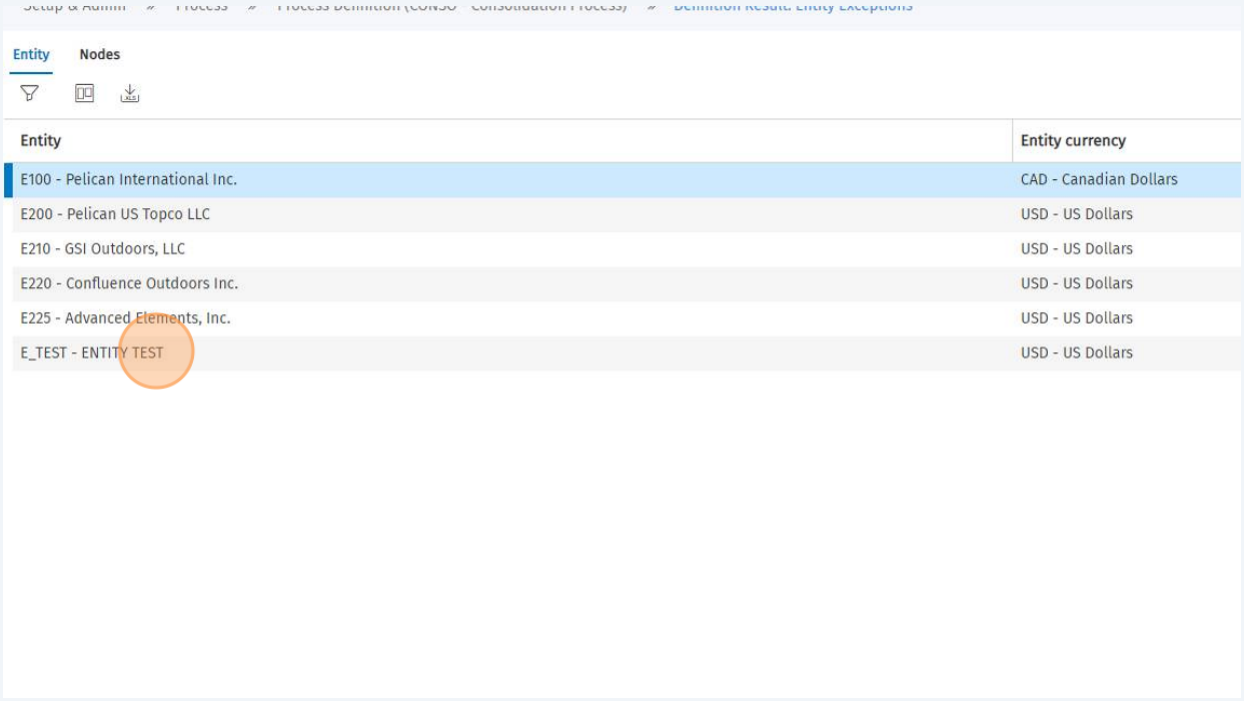

13 Click "Process definition"

14 In the "Organisation and Workflow" icon select "Define results" from the organisational hierarchy.

15 Here we can see that the entity is correctly

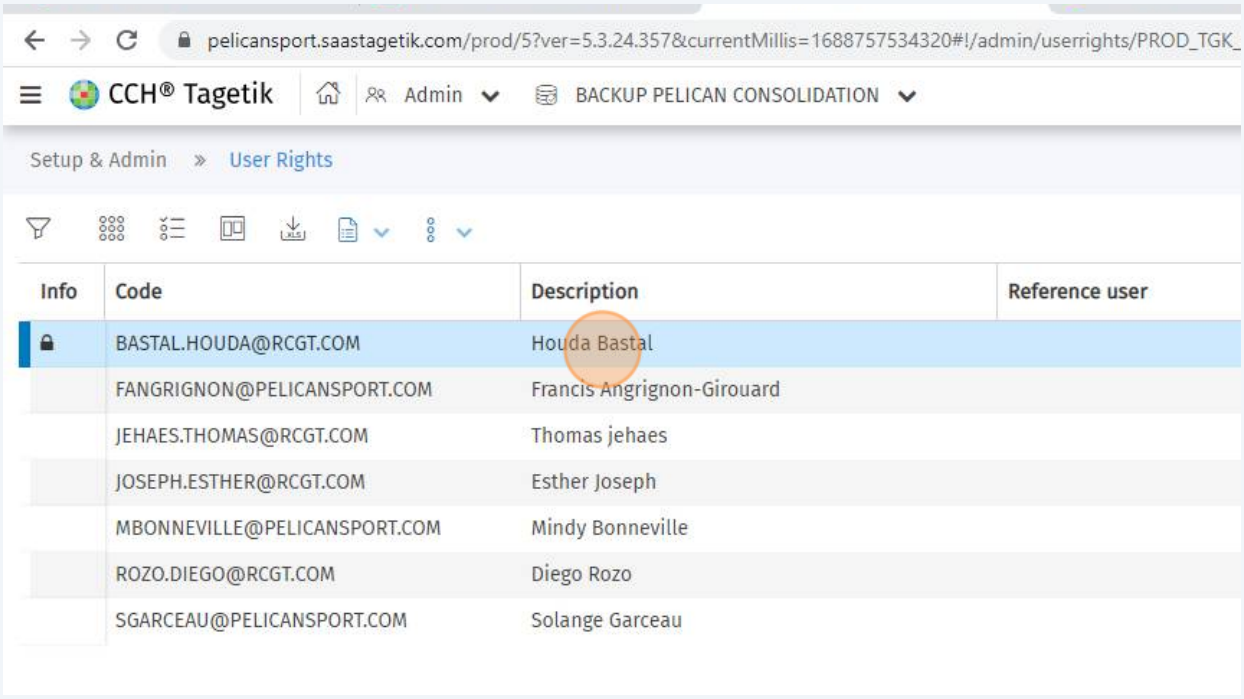

From "User rights"

16 Go to the "User rights"

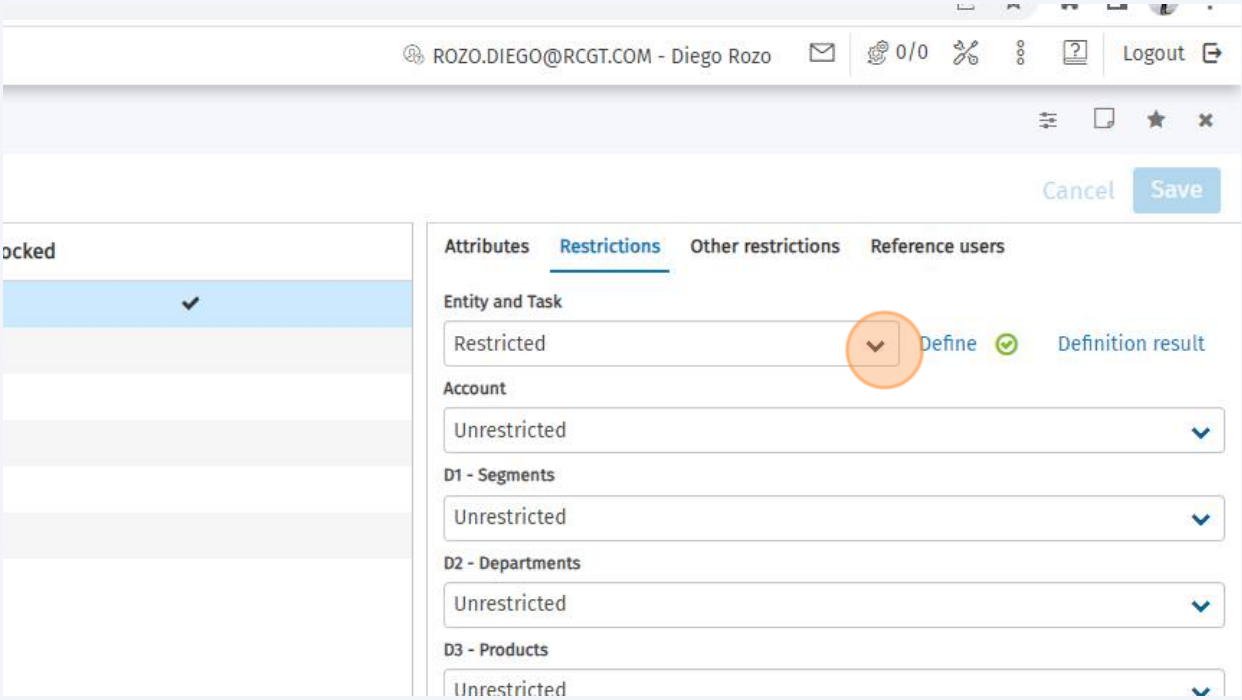

17 From the user rights, we have a way to restrict users to certain elements that they should see. That is, they have limited access. Example: If a business group decides that each company has access to only its data and entities, it is from here, where we can make these restrictions.

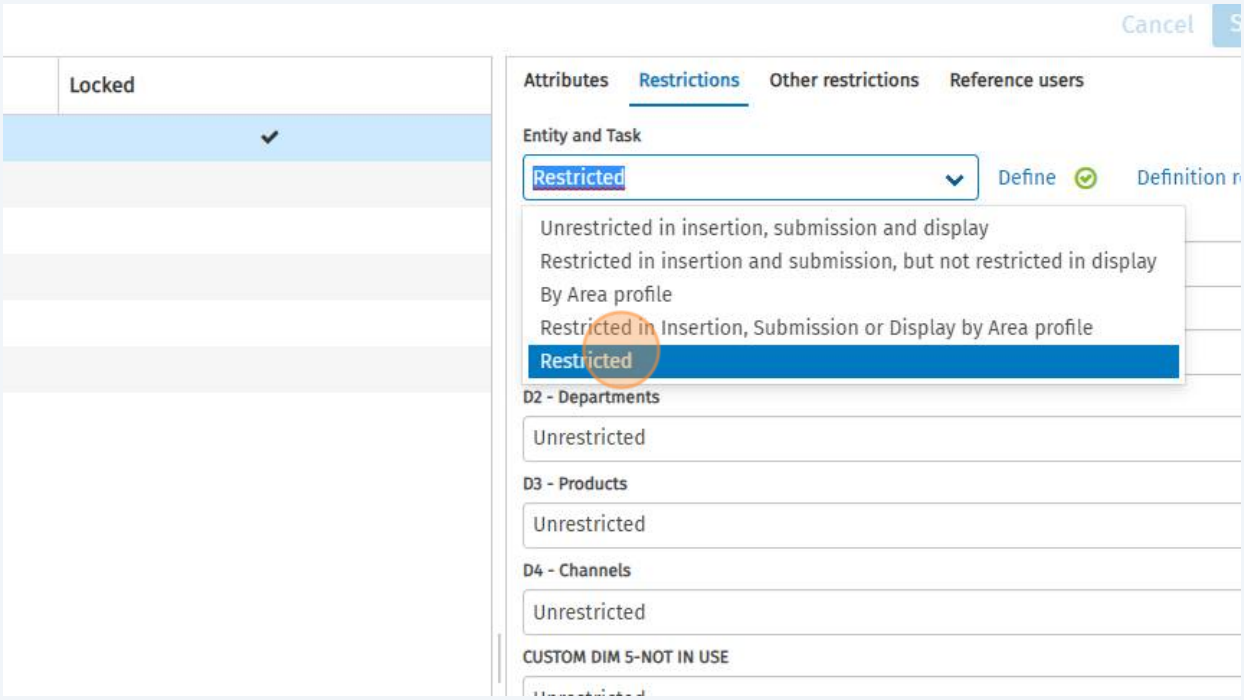

18 In the "Restrictions" tab we can see that it shows us the available dimensions in the system and there we can see if a restriction should go there or not. To give an example with the following image;

• When we see the entity, we can see that it has a restriction, that is to say, it has a limited access.

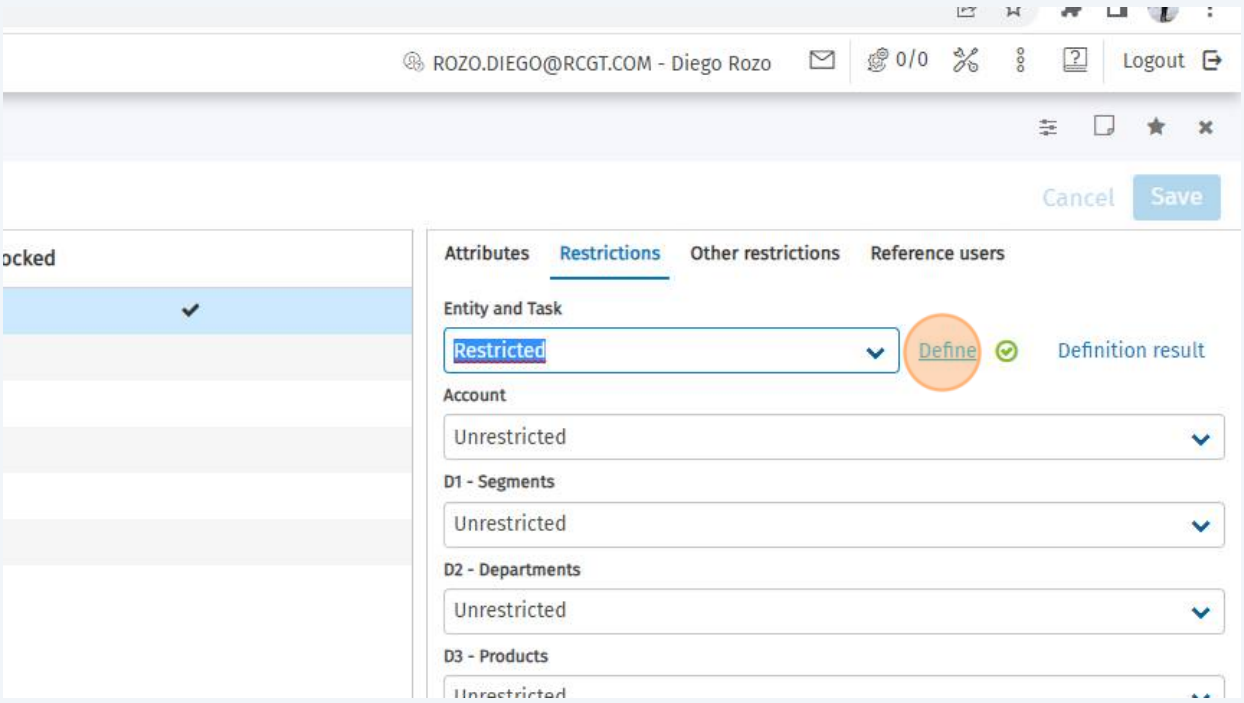

• But if we see the other dimensions, they appear without restrictions, that means that it has access to all the information under each of the dimensions.

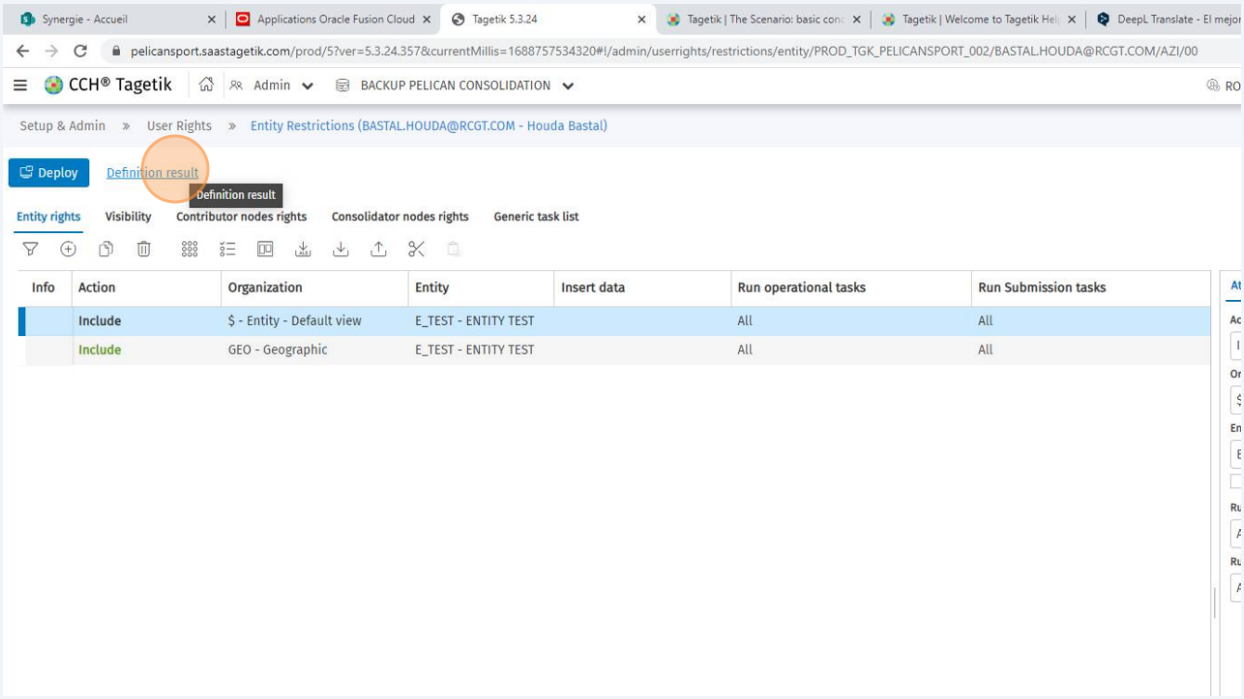

19 These are the different options available for restrictions

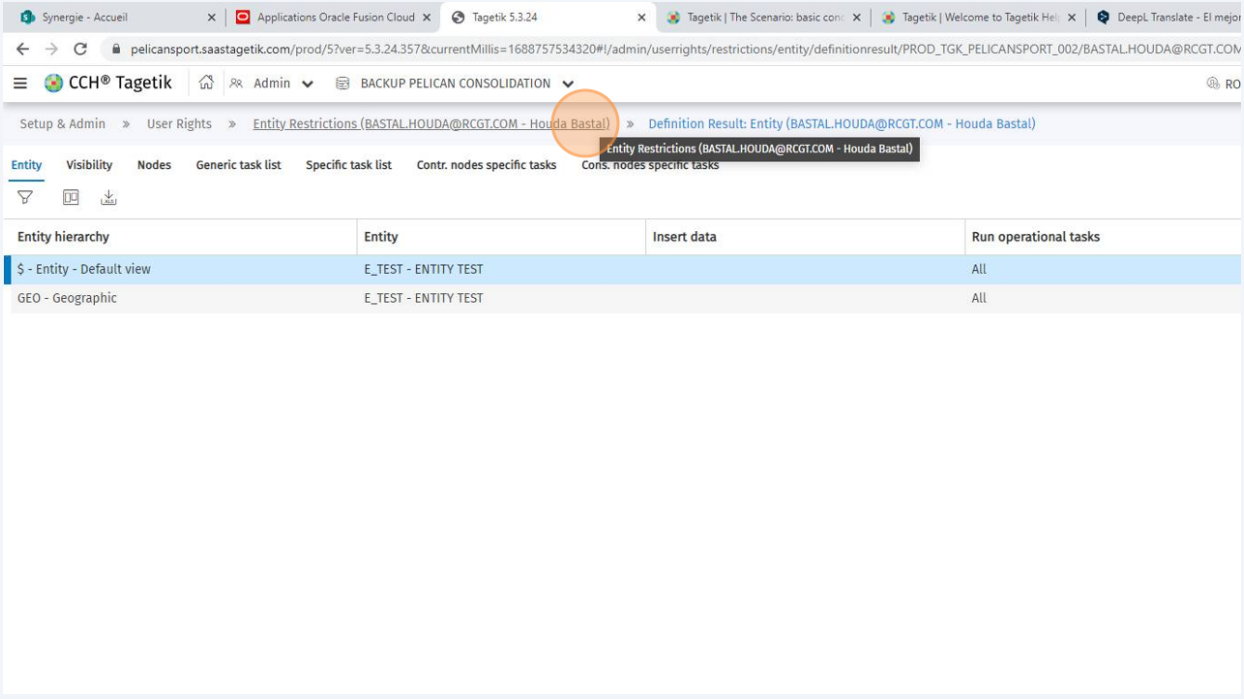

20 When selecting restricted we go to the option define.

21 Here we set the restrictions that the user will have. If you have the right to view on some entities. After this, go to the Definition results

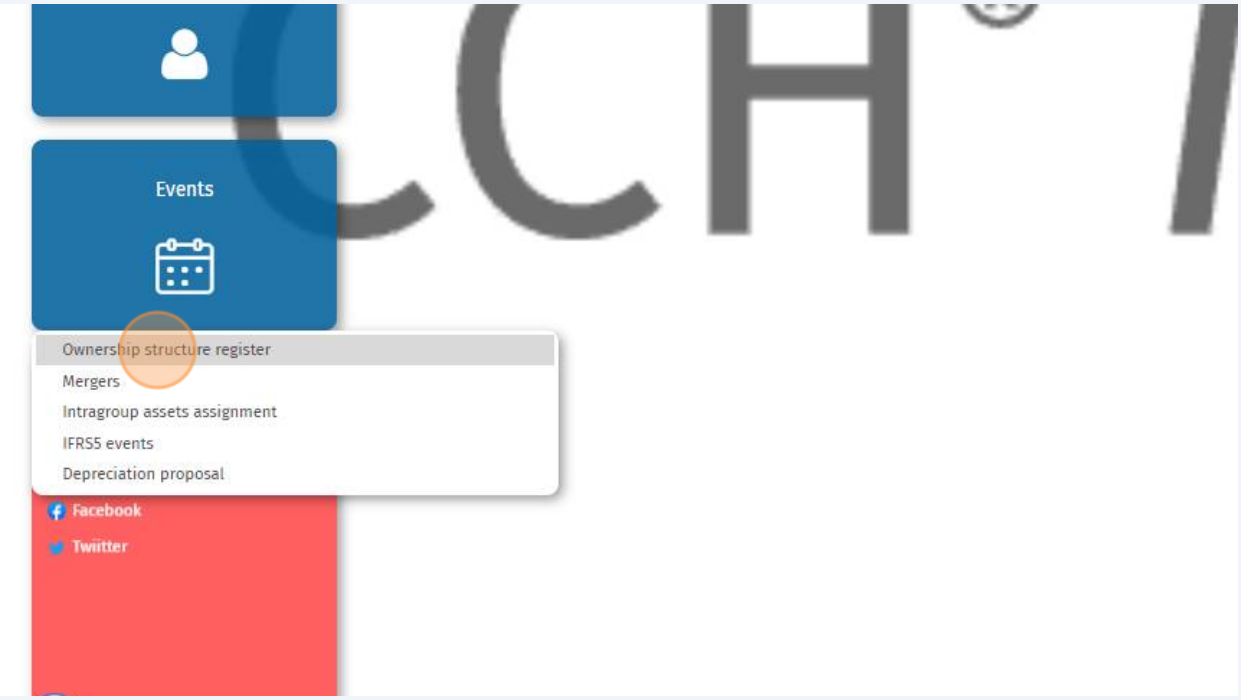

22 In this example, it tells us that the entity "E_TEST" is available in the hierarchy "Entity - default view and GEO - Geographic" with permission to run all tasks of this entity.

From Ownership Structure Register

23 This space is of utmost importance, given that when a new company is acquired, here we can relate the entity with its percentage shareholding, who owns whom, the carrying value. This information will be useful at the time of launching the consolidation to show if the eliminations are performing well for the new company.

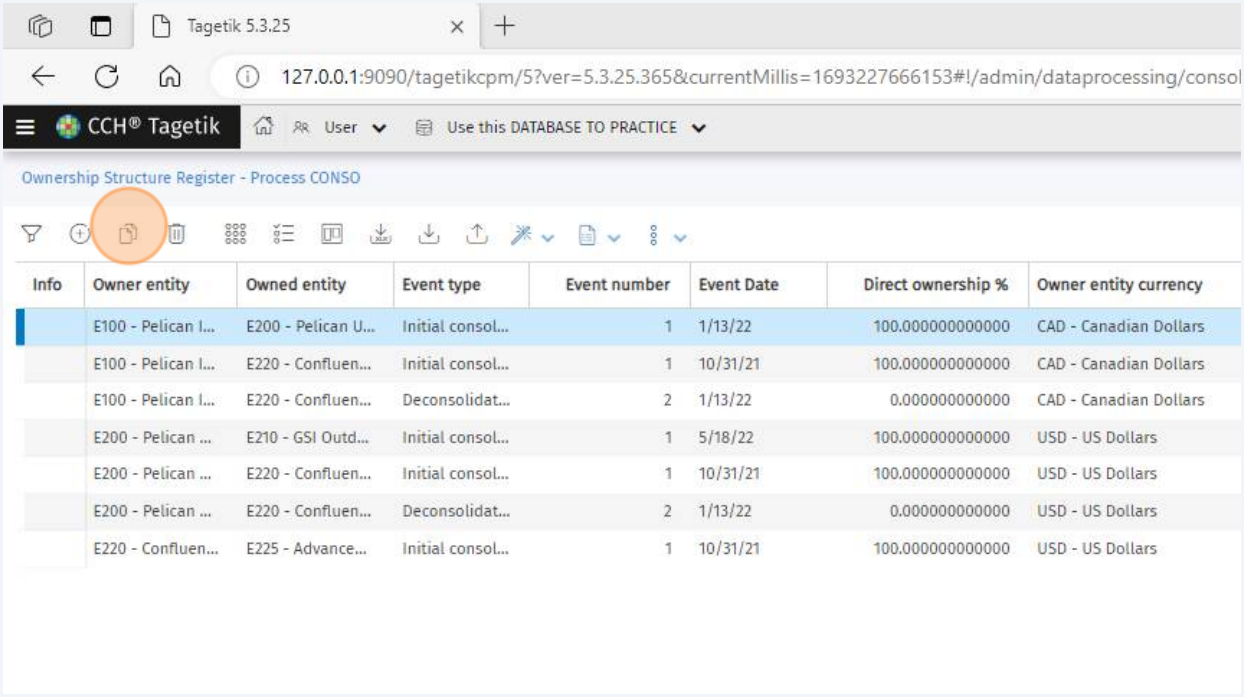

24 Go to Events »» "Ownership structure register"

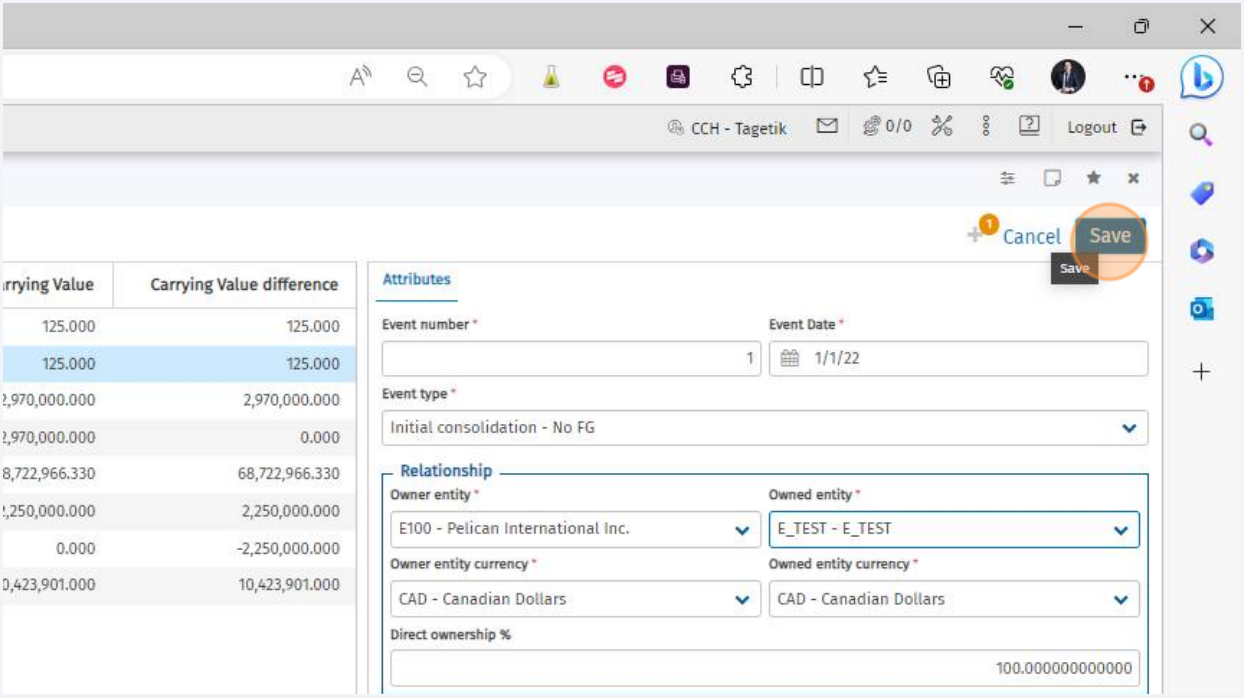

25 Select the process

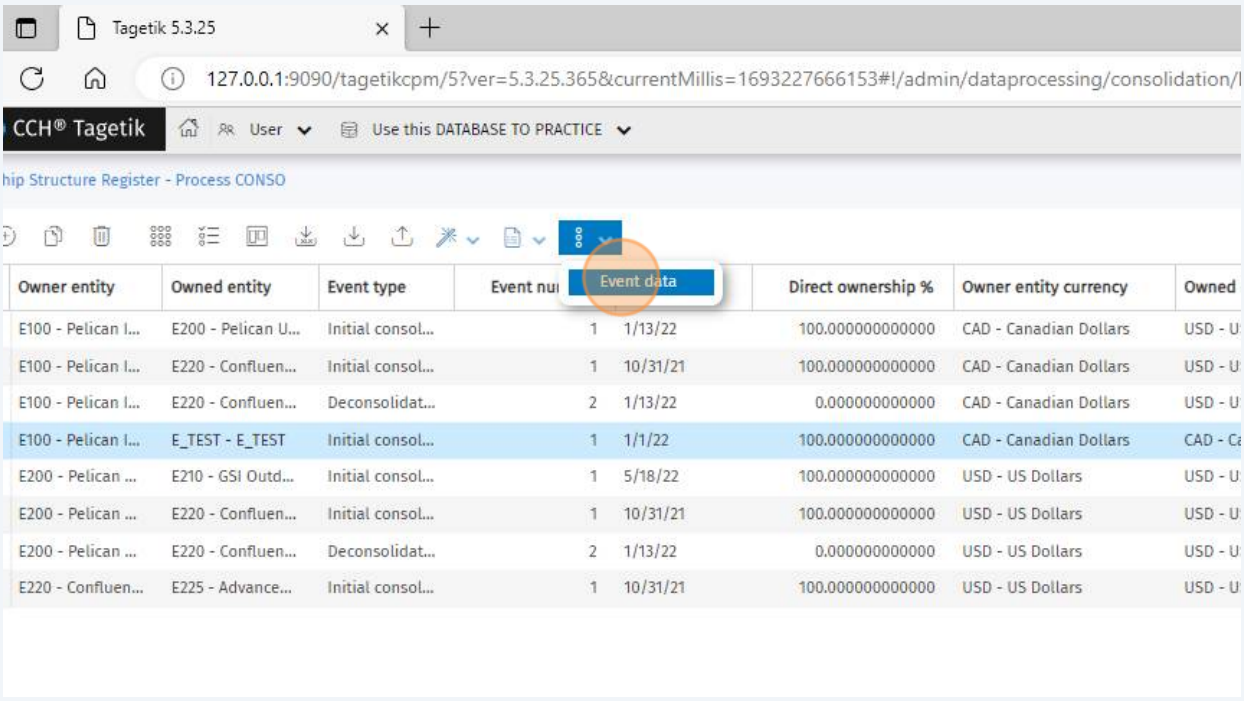

26 Select any line and click on clone.

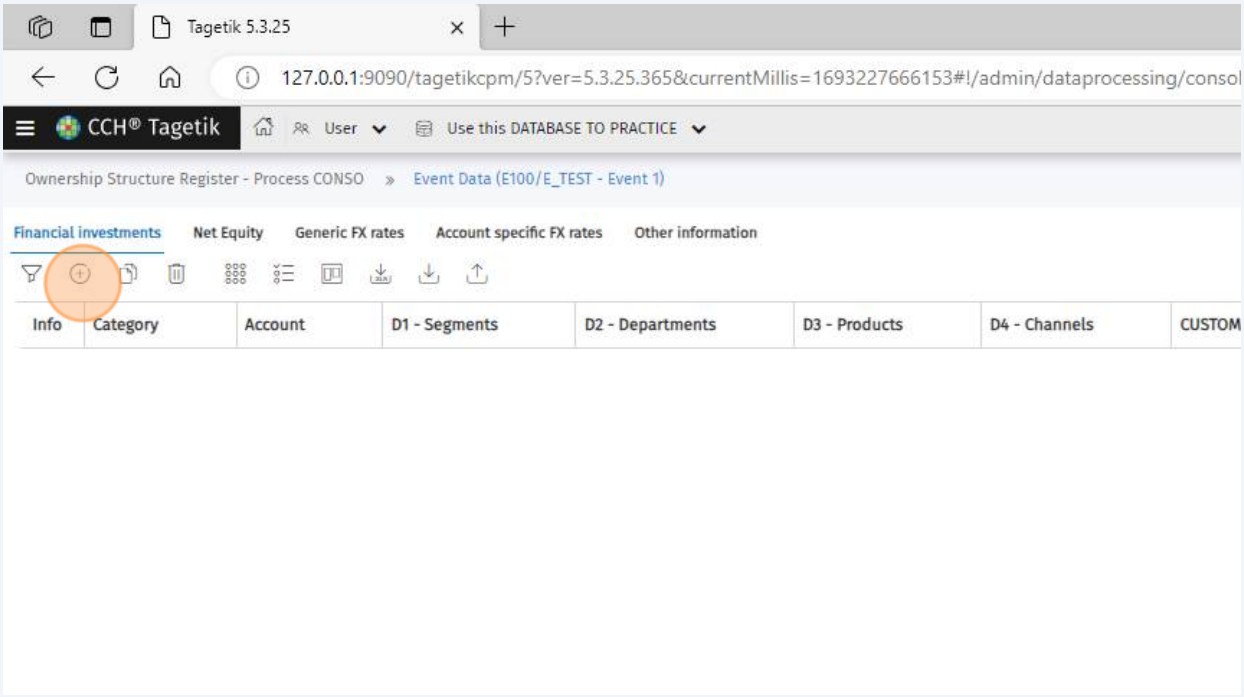

27 When you create the new line by clicking on clone, you must change all the fields in the attributes tab. As it is a new company, the event number must be 1. Set the date when the company will start, for the event type we include the option "Initial Consolidation - No FG". Establish the owner entity and the new company created, as well as the currency of each and their percentage shareholding. Then click on save

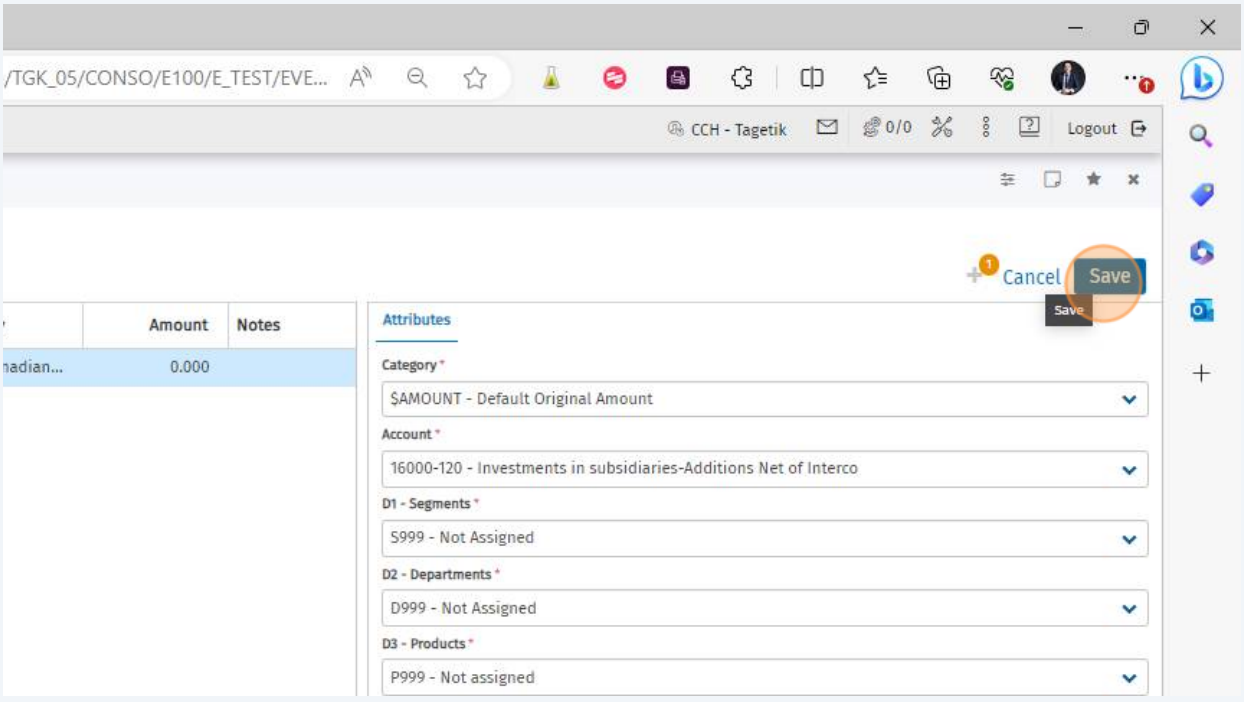

28 Click "Event data"

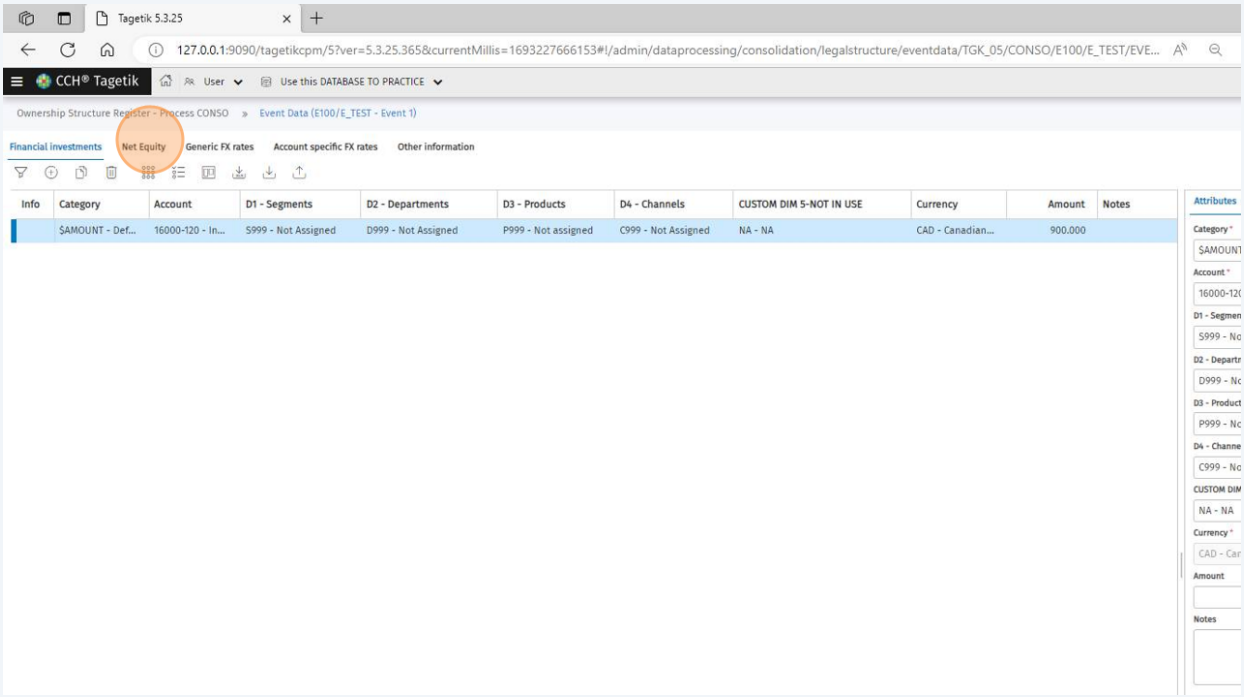

29 In the "event data" we usually have to record the operation of the investment held by the Owner entity and at the level of equity held by the Owned Entity.

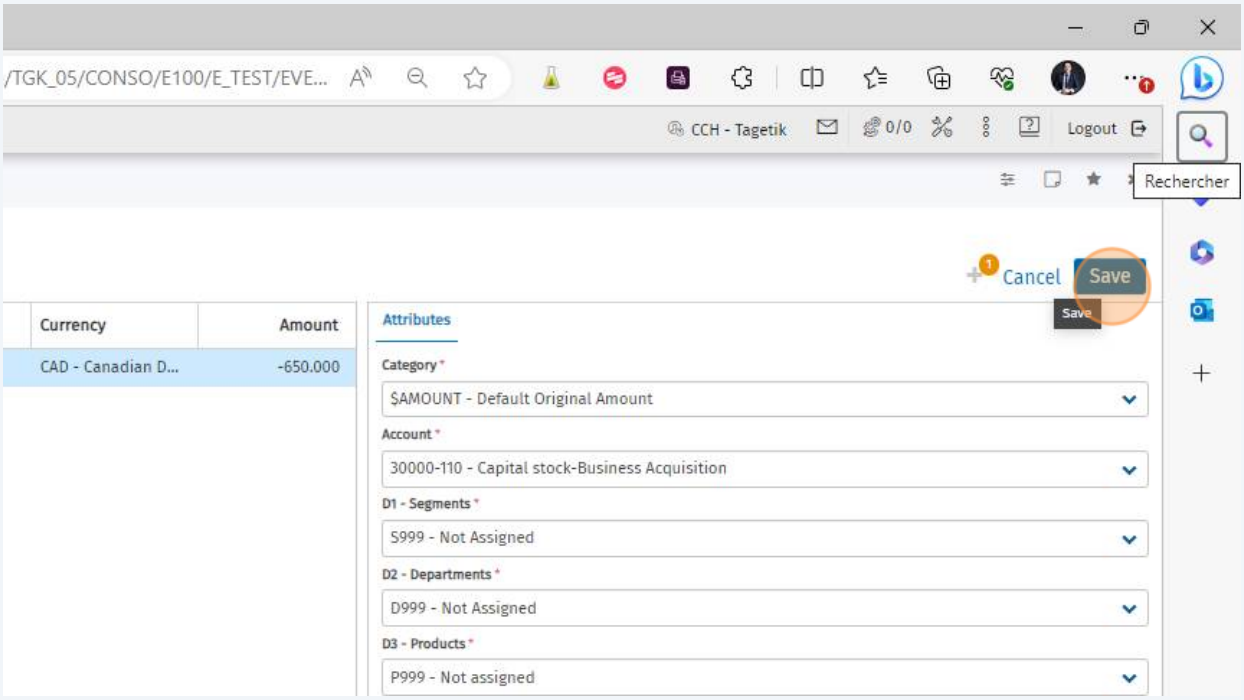

30 Click "Save"

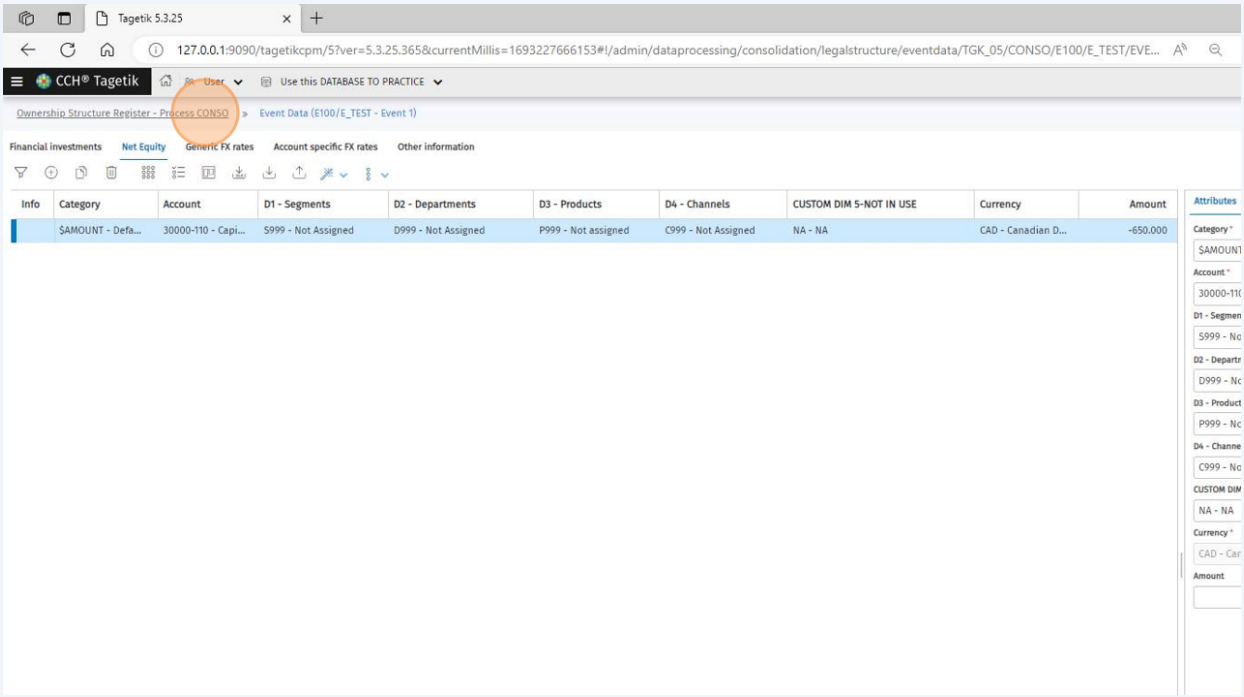

31 The fields of the company's investment are filled in and then we go to the "Net Equity" tab.

32 Click "Save"

33 The fields of the "Net equity" are filled. After this, click on save.

From Data Integration

34 ETL; It should be assessed whether the new company will have a specific ETL to load its balance sheet data.

35 Data Entry; In the event that the new company decides to enter its balance sheet manually, this can be done by means of data entry.

36 Reports; In the reports, the new entity can be assigned if necessary. If it is part of a consolidation group, it must be within the corresponding hierarchy.
